[2] SALT RULES HAVING THE FORCE OF LAW.—Under section 2 of 33 and 34 Victoria, chapter 59 (Contracts), regarding execution of contracts by the Commissioner, Deputy Commissioners, and Assistant Commissioners of Salt Revenue—Government of India, Home Department Resolution, Fort St. George Gazette, dated 24th June 1879. Under section 6, General Act VIII of 1878 (Sea Customs), appointing Salt Commissioner as Customs Collector for the purposes of section 138—Revenue Notification, Fort St. George Gazette, 19th September 1882. (1) Under section 8 of General Act XII of 1882 (Indian Salt), fixing the price of salt sold at Tuticoria for export to Penang exclusive of duty—Revenue Notification, Fort St. George Gazette, 17th October 1882; (2) Revenue Notification, Fort St. George Gazette, dated 25th April 1882, fixing the price of salt sold at Covelong for export exclusive of duty; (3) Revenue Notification, Fort St. George Gazette, dated 19th December 1882, fixing the price of salt sold at Coolangooly in the Tinnevely district at six annas per maund exclusive of duty; (4) Government of India Notification, Department of Finance and Commerce, No. 1449, dated 10th March 1882, Fort St. George Gazette, dated 30th March 1882, reducing duty on salt manufactured in, or imported by land into, any part of British India. (1) Under sections 8, 9 and 12 of General Act VI of 1881 (Transit Duties), declaring route by which goods may be allowed to pass into or out of French territory, and constituting certain railway stations as custom chowkies, and authorizing the station-masters thereof to exercise certain powers—Revenue Notification, Fort St. George Gazette, dated 16th December 1879; (2) under section 12, declaring certain other routes—Fort St. George Gazette, 22nd August 1882. (1) Under section 45 of Madras Act VI of 1871 (Salt Excise), laying down conditions of license—Notification by Revenue Board, Fort St. George Gazette Supplement, 1st March 1882; (2) under section 14, declaring Hosdroog to be a port—Revenue Notification, Fort St. George Gazette, dated 13th September 1881; (3) under section 45, Revenue Notification, Fort St. George Gazette, dated 12th June 1877, extending the Act to Malabar and South Canara; (4) Revenue Notification, No. 38, Fort St. George Gazette, dated 23rd February 1882, extending the Act to certain villages in Tinnevely district; (5) under section 44, framing rules—Notification by Board of Revenue, dated 8th March 1882, Fort St. George Gazette Supplement, 9th March 1882; (6) Revenue Notification, Fort St. George Gazette, dated 13th March 1883, extending the Act to certain tracts in the Kistna district; (7) Revenue Notification, Fort St. George Gazette, dated 13th March 1883, extending the Act to Madurantacam talook in the Chingleput district; (8) Revenue Notification, Fort St. George Gazette, dated 13th March 1883, extending the Act to Tindivanam talook in the South Arcot district; (9) Revenue Notification, Fort St. George Gazette, dated 18th March 1883, extending the Act to Tonkaray talook in the Tinnevely district; (10) Revenue Notification, Fort St. George Gazette, dated 20th March 1883, extending the Act to a portion of Goodoor talook in Nellore district; (11) Revenue Notification, Fort St. George Gazette, dated 8th May 1883 extending the Act to a portion of Puttocottah talook, Tanjore district; (12) Revenue Notification, Fort St. George Gazette, dated 15th May 1883, extending the Act to Sooloorpett magisterial division in Nellore district; (13) Revenue Notification, Fort St. George Gazette, dated 30th October 1883, extending the Act to Chicacole talook in Ganjam district; (14) Revenue Notification, Fort St. George Gazette, dated 30th October 1883, extending the Act to a portion of the Binlipatam magisterial division in Vizagapatam district; (15) Revenue Notification, Fort St. George Gazette, dated 30th October 1883, extending the Act to Narsapore talook in Godavery district; (16) Revenue Notification, Fort St. George Gazette, dated 30th October 1883, extending the Act to Cundooore talook in Nellore district; (17) Revenue Notification, Fort St. George Gazette, dated 11th December 1883, extending the Act to Trivathauny magisterial division in the Madras district; (18) Revenue Notification, Fort St. George Gazette, dated 21st December 1883, extending the Act to Nellore talook in the Nellore district; (19) Revenue Notification, Fort St. George Gazette, dated 8th January 1884, extending the Act to the Repally talook in the Kistna district; (20) Revenue Notification, Fort St. George Gazette, dated 22nd January 1884, extending the Act to the Chidambaram talook in the South Arcot district. (1) Under sections 1 and 2 of Madras Act VI of 1878 (Salt Commissioner), authorizing the Commissioner of Salt Revenue to delegate all his powers under Regulations 11 of 1803, 1 of 1805, and Madras Act VI of 1871, to Assistant Commissioners subject to the supervision and control of Deputy Commissioners and to Deputy Commissioners subject to the supervision and control of the Commissioner—Revenue Notification, Fort St. George Gazette, dated 25th March 1884; (2) under section 2, Revenue Notification, Fort St. George Gazette, dated 23rd March 1881, withdrawing powers of Collectors under the salt laws. (1) Under section 1 of Madras Act I of 1882 (Salt Laws Amendment Act), extending the Act to certain local areas from the 1st April and 1st May 1882—Revenue Notifications, Fort St. George Gazette, 1st and 16th April 1882; (2) Revenue Notification, No. 108, Fort St. George Gazette, 30th May 1882, extending the Act to Madras district from the 1st June 1882; (3) Revenue Notification, No. 120, Fort St. George Gazette, 13th June 1882, extending the Act to Coimbatore circle from the 15th June 1882; (4) Fort St. George Gazette, 5th September 1882, No. 478, extending the Act to Madanapally talook; (5) Fort St. George Gazette, 12th September 1882, extending the Act to Calasaty zemindary; (6) Fort St. George Gazette, 19th December 1882, No. 755, extending the Act to Salem; (7) under section 27 (h), Revenue Notification, Fort St. George Gazette, dated 29th August 1882, framing rules for grant of compensation to persons improperly arrested or charged; (8) under section 27 (c), framing rules for the adjudication of confiscations and confiscated articles—Fort St. George Gazette, dated 29th August 1882; (9) under sections 27 (j) and 28, framing rules for prohibition of the manufacture and refining of saltpetre—Fort St. George Gazette, 19th September 1882.

the last being almost wholly preventive. The duties of the Deputy Commissioners, and of Assistant Commissioners under them, consist principally in the inspection and supervision of the work of the factory and preventive establishments, and of the manufacture and sale of salt. The former also exercise the power of sanction of all works entered in the budget not exceeding in cost Rupees 250 in the case of new works, and Rupees 500 in that of repairs. The treasury accounts of each division are made up in the central office from unclassified cash accounts rendered direct by the factories, and classified contingent accounts are compiled in the Assistant Commissioners' offices and submitted direct to the Commissioner, the Deputy Commissioner not being concerned with their preparation in the absence of special orders. All other correspondence passes through his hands. The immediate supervision of manufacture and sale is vested in the inspectors and assistant inspectors, officers who draw from Rupees 400 to Rupees 250, and Rupees 175 to Rupees 150, respectively, with an intermediate grade of probationary inspectors on Rupees 200. The factories are grouped in circles containing from one to four according to circumstances. An assistant inspector is allowed for each factory and an inspector for each circle, but the former is only the assistant of the latter and not in charge of the factory to which he is posted except in the absence of the latter, and then only to a limited extent. In addition to general superintendence their special duty is the check-weighment of every consignment of salt which leaves their platforms, and it is on the care with which this class of well-paid officers carry out this operation that the whole system for the prevention of fraud depends. The superior factory officers also attend to the preventive work of their circles, for which purpose a special force is usually provided. The sub-inspectors (drawing Rupees 70 to Rupees 30) are more closely concerned with manufacture and storage than anything else. The estimation and rejection, if bad, of all salt as scraped, and its subsequent storage, are their particular duties. Each sub-inspector is also usually placed in general charge of a platform and held responsible for its condition. The petty officers (on Rupees 15 to Rupees 9) are entrusted with the detailed supervision of the peons, particularly in connection with sentry duty, and also conduct sales. The protection of the pans and platforms forms the principal work of the peons, whose numbers have to be kept sufficiently high to provide adequate reliefs for the line guards during the manufacturing season. To allow of this being done economically a certain number of these officers are temporary. In addition to guarding and other ordinary duties, the peons execute petty works and repairs at a considerable saving to Government. They are also instructed in the use of fire-arms and taught a moderate amount of drill.

602. FACTORIES.—The localities at which salt is now manufactured have to a certain extent been determined by the existence of factories at the same sites on the constitution of the monopoly system in 1805, as the manufacturers at these localities are entitled to compensation should Government see fit to close their works. The larger number have however been opened out since with reference to increases in the demand for salt. During the earlier part of the century new factories were established in great numbers along the coast, owing partly to the fact that the state of communications was such as to render transport over considerable distances an expensive proceeding. The low rate of duty then in force, by decreasing the incentive to malpractices, also rendered their number a matter of less importance than it now would be. Latterly the tendency has been to concentrate manufacture at the sites which afford the greatest facilities for distribution into the interior; a course which the highly-paid establishments allowed under the reorganized system has rendered absolutely necessary. The area occupied by the works in each case being usually small compared with that suitable for the purpose, there has been but little difficulty in effecting this concentration. In a few instances however, such as in parts of the Vizagapatam, South Arcot and Tanjore districts, this is not the case, and it has been found necessary to retain some small factories to meet a demand which could not be otherwise adequately provided for. Considerations connected with the state of communications have led to the same course being adopted elsewhere. On the west coast manufacture has long been in a declining condition, neither the soil nor the climate being

suitable for the production of salt of good quality ; and it only survives in three small factories in the north of the South Canara district, the abolition of which is now under consideration. The area occupied by salt works may, roughly speaking, be set at 12,500 acres, almost the whole of which land is valueless for other purposes. A map showing the factories now in existence is excluded here by necessities of publication, but will be found in the collection of maps given with Vol. III.

603. MANUFACTURE.—Salt is manufactured in this Presidency solely by means of solar evaporation ; the only requirements necessary to allow of a factory being established being the existence of a strata of tough impermeable clay, or the means of constructing one, and of a sufficient supply of brine. The former almost invariably exists in salt swamps, the process which creates these large low flats also favoring the deposit of stiff tenacious mud. The brine made use of is derived either from the sea, or from brine-pits and wells. In the former case, which is most common in the north of the Presidency and the Chingleput division, tidal backwaters usually furnish the source of supply. Each factory is covered with a network of small channels, all opening into one or more main channels communicating with the backwater or sea. These main channels are provided with appliances for retaining water at the highest possible level, so as to allow of a supply sufficient to last for several days being secured at spring tides. The retention of the water in the channels at the highest possible level is a matter of much importance, both in reducing the lift into the condenser and in rendering the existence of deep channels and heavy annual repairs thereon unnecessary. The natural features of the locality often facilitate the process by rendering it possible to include considerable areas low enough to be submerged at high tide within the system of dams, and thus exposing large condensing surfaces in addition to improving the supply of water available. In other cases the inclusion of large deep creeks brings with it also the latter advantage. The water from the small irrigation channels is baled into the condensing beds by means of picottahs or slung baskets, and the process of manufacturing then proceeds in the usual way. Brine-pits form a more economical source of supply, as the brine so obtained is usually highly concentrated, and in some cases even approaches saturation towards the close of the hot weather. This high degree of salinity greatly reduces the labor of raising the water into the beds, which constitutes one of the most serious items of expenditure in the manufacture of salt. The process of manufacture to be followed subsequent to the brine being raised to the level of the pans is when duly carried out that of allowing it to concentrate in a series of condensers until it reaches the degree of density at which salt begins to form (about 25° Beaume), by which time the less soluble impurities will have crystallized out ; and then running it into small beds or pans, the flooring of which consists of hard tough clay, puddled and rammed so as to render it but little liable to disturbance by the manipulation of the salt when removed. The process of evaporation is allowed to continue in the pans until the point of crystallization is reached for magnesium salts which it is desired to remove. By that time almost the whole of the chloride of sodium has separated and exists in the form of a thin white coat of salt, partly covered by the residual brine. The salt is then raked up with a narrow piece of wood about two feet long, into the centre of which a long bamboo is fixed at right-angles to act as a handle. When skilfully used this instrument removes the salt with very little disturbance of the clay of which the bottom of the beds is composed, and by means of a few passes backwards and forwards with it, the particles of mud which adhere are washed out into the mother liquor. The salt is then collected in baskets and carried to the drying grounds. In practice this system is subject to great modifications, each factory having its own method, the result of custom. The most common faults which are allowed to occur in the process are the introduction of imperfectly-concentrated brine into the crystallizing beds ; and this is aggravated when the depth to which it is admitted is insufficient to allow of the production of well-formed and pure salt, and the non-removal of the residual mother liquor. The accumulations of the magnesium salts which show themselves in the condensers after a few scrapings, if not removed, accelerate the deposit of sodium chloride, and as this fact is known to the manufacturers difficulty is experienced in securing its removal. The differences in the procedure adopted in each circle

and the varying state of the weather render it impossible to afford any information as to the number of crops of salt which may be collected during the season, but with a fairly perfect system scraping should take place once in from six to ten days. The yield in a good season varies from about 1,000 maunds per acre in the north to 4,000 maunds per acre in some of the most favorably-situated factories in the south of the Presidency. The division of the area allotted to each manufacturer into condensers and crystallizing beds is effected by means of small bunds of the tough clay referred to above. The proportion devoted to these two portions of the process varies much even where sea-water is used, the old factories having always an insufficient condensing area. In some of the factories most recently established a proportion of four to one has been adopted and is found to work well. Where pit brine is made use of it is impossible to lay down any rule of this sort, as the strength of the brine varies with the locality and the stage of the season. The most important point in the manufacture of salt lies in the formation of the crystallizing beds, on the impermeability and cleanness of the flooring of which both the quantity and quality of the salt produced chiefly depend. These beds are prepared by a tedious and often-repeated process of puddling with the feet, which is done at intervals of a few days during the earlier part of the season, and is aided in some places by the addition of mud or sand to the surface as the nature of the soil may render necessary. It must be repeated to a certain extent after about every third scraping. The manufacturers belong for the most part to the same class as the ordinary agricultural population, and are employed in cultivation during the wet weather. They are not however well off as might be expected under the circumstances, partly owing to the extreme poverty of the cultivable soil in the neighbourhood of most of the factories. The work of manufacture is severe and not only has to be performed in the hottest time of the year, but increases in direct proportion to the heat. The preparation of the pans usually commences early in January. The first salt is scraped some five or six weeks later, and manufacture is continued until stopped by the rains, which usually takes place about June in the north of the Presidency and in August or September in the south.

604. MONOPOLY SYSTEM OF TAXATION.—Under the monopoly system salt can only be manufactured for sale to Government, and under the supervision and control of its officers. The right to manufacture is confined to certain areas called factories, and to the registered owners or holders of definite portions of the factories called sets of pans. The quantity, if any, to be manufactured at each factory is determined yearly by the head of the department, on consideration of the stocks in hand and probable requirements of the trade. The pecuniary rights of the manufacturers are no more than to produce this amount and deliver it at the place of storage in return for a price or contract rate called *coodivaram*, which varies from Rupees 6-5-0 to Rupees 26-12-0 per garce of 120 maunds. The proprietary rights of the manufacturers in the areas on which they conduct their operations are very various, and are intimately connected with the amount of *coodivaram* which they receive. In many cases their rights resemble full ownership; they are however always subject to the condition that the land can only be used for the manufacture of salt for sale to Government, and that with the permission of, and to the extent prescribed by, its officers. In most cases the question of tenure is involved in obscurity. In factories which have come into existence since Regulation I of 1805 was passed, the tenures are only based on custom and are not supported by legal enactment. All expenditure on the upkeep of works is borne by Government, the manufacturers being practically contractors who undertake to produce a certain amount of salt within factory limits and deliver it into store. The salt is stored at the expense and risk of Government, and sold at a rate equivalent to the duty for the time being plus the estimated cost of its production, which for the present has been fixed at an average rate of 3 annas per maund for the whole of the east coast. At Pondrauca in the Masulipatam division a slightly different system is in force. Spontaneous salt is produced in the swamps in its vicinity in abundance with but little artificial assistance, and is collected and removed to the platforms by coolies who receive a contract rate of Rupees 5 per garce for the work.

605. After being passed and estimated by the officers of the department, the salt is at once removed to drying grounds or the platforms on which storage is to take place : and there left until dry enough to be weighed into store, which is usually a month or so after scraping. It is then stored in heaps containing 1,200, 2,400, or 3,600 maunds each according to the extent of the sales. The factories of the Chingleput district are not conveniently situated as places for the storage and sale of salt ; almost the whole of their produce is conveyed to Madras by canal, at the expense of Government, and stored in a *dépôt* close to the Madras Railway and connected therewith by a siding. The additional cost which this entails is not inconsiderable, but it is a convenience and an economy to the large population in the interior who derive their supply from the *dépôt*. The heaps, which stand on a rectangular base, are thatched with straw or palmyra leaves in the north of the Presidency, and covered with a thick layer of tempered clay in the south ; the latter are found to afford sufficient protection during the short rains of that part of the country. The period during which the salt remains in store varies with the stocks available at each factory. A considerable loss is always sustained through wastage, regarding the extent of which it is impossible to lay down any fixed rates. A loss of 3 per cent. in six months, 5 in twelve, and a smaller proportion for longer periods is the average. Salt is sold at all monopoly factories except the Madras *dépôt* in quantities of one maund and upwards. At that *dépôt* the minimum has been fixed at 40 maunds. The minimum at excise factories is 25 maunds. Sales are conducted by petty officers, but all salt has to be removed in bags containing one or two maunds each, and a certain percentage of those in each consignment is tested by either the inspectors or assistant inspectors before it is allowed to leave the place of storage. A check on the accuracy of sales is thus imposed, without the waste of time which the actual conduct of sales would entail on the superior officers of the department were they to undertake it in person. A further precaution against dishonest practices is secured by the test-weighment of some of the heaps in store. Six months' credit is allowed to traders on deposit of Government securities sufficient to cover the value of the salt purchased. A large amount of capital has been drawn into the salt trade by this system, to the advantage of consumers in the interior. The amount for which a credit account can be opened has lately been reduced to Rupees 500, and transactions under the rules are increasing.

606. To obviate the heavy loss which the suppression of the use of salt earth, hereafter to be mentioned, would otherwise entail on the fishing classes, who have hitherto been accustomed to cure their surplus fish with it, enclosures have been opened along the coast for the sale of salt at very low rates. Operations are only allowed to take place within the enclosures. These have been highly successful. There are now 137 along the coast, in which 320,922 maunds of fish were cured during the past year. The salt is sold in these cases at prices varying from 6 to 12 annas per maund, the higher rates being confined to the West Coast where the cost price of the salt itself is very high. The success of the experiment has been greatest in Malabar.

607. EXCISE SYSTEM OF TAXATION.—Under the excise system Government confines itself to the levy of a duty, at present fixed at Rupees 2 per maund, on salt leaving the factory ; and does not interfere with manufacture or storage, except so far as is necessary to facilitate the collection of this duty by regulating storage operations, and by insisting on the works, on which large sums of public money have been spent under the old system, being kept in efficient repair. Expenditure on the repair of works for the purpose of manufacture and storage, for the protection of the factory from floods, and for preventing the removal of salt before duty has been paid and for facilitating that of duty-paid salt, is borne by the excise licensees, as the manufacturers are then called. The licensees are also charged with interest at 5 per cent. on the capital cost of all permanent works of the above descriptions which have been constructed by Government in former years. With the sale of the salt the officers of Government have no concern and the licensees are at liberty to charge what prices they think fit. It was hoped that this system, by fostering competition amongst the licensees of each factory, would improve the

quality and reduce the price of salt, but the results have not entirely answered expectation. At most factories the old manufacturers are poor and improvident and are so much dependent on the regular disbursement of coodivaram that they are unable to wait for the larger but deferred profits which would accrue to them under the excise system. They are consequently obliged to apply to capitalists, who purchase the whole season's produce during the process of manufacture. The licensees in addition to the interest referred to above are liable to the payment of rent for their holdings, but under recent orders on the subject this charge will become nominal.

608. IMPORTS, EXPORTS AND FRENCH SUPPLY.—The only coast district where no salt is manufactured is Malabar, but the outturn of the Canara works is very small; and both these districts are dependent on imports from Bombay and Goa. The imports were formerly undertaken by Government, but are now in the hands of private dealers who trade in salt as they would in any other article of merchandise. The restrictions placed on the carriage of duty-bearing salt in pattimars by India Act XVI of 1879 have now put an end to the import of any but the duty-paid article. Exports used formerly to take place to Calcutta, Chittagong, the Straits Settlements and Penang to a very considerable extent, surplus stocks being sold for the purpose at unremunerative rates. This trade was however destroyed by unnecessarily severe restrictions introduced to prevent abuses. Of late a more liberal policy has been adopted, and the grant of an allowance for wastage on the voyage offers prospects of an early revival of the trade with Calcutta. Similar advantages have however been refused to consignments to the Straits Settlements and Penang. Under certain conventions with the French Government arrived at early in the present century, no manufacture takes place within their settlements. They receive their supply from the British factories, and are bound to sell it at approximately the same prices as prevail in British territory. In return for these concessions they receive annual payments amounting to Rupees 4,41,600 in all. The greater part of Mysore and a portion of Hyderabad, the Central Provinces and Orissa also receive their salt supply from the Madras Presidency through the agency of private trade.

609. PREVENTIVE MEASURES.—The institution of a regular preventive force was one of the principal changes connected with the recent reorganization of the Salt Department. Madras Act I of 1882 gives very considerable powers to the officers of the Salt Department in cases connected with offences against the salt revenue, but the stringency of its clauses is tempered by the provision that prosecution shall only take place in each case with the sanction of the inspector in charge of the circle, before whom all offenders must appear in the first instance. Departmental orders direct the release with a warning of all very old, infirm and very young persons, of pregnant women, of offenders when the quantity of contraband salt concerned does not exceed one seer of illicit salt or five seers of salt earth, and persons who can make a reasonable defence on the ground of ignorance or inadvertence. More than half of the offenders charged have been departmentally released with a warning. During the past few years the persons dealt with have been as at foot.[²] Persons who have been departmentally released are seldom found to offend again, but should they do so they are held not to be entitled to the benefit of these rules. The whole Presidency, with the exception of a small portion of the Goontoor circle, has now been provided with preventive forces. The men are divided into parties of from five to eight peons under a petty officer to which

specified ranges are allotted, and their work is supervised by an inspector aided by one or more sub-inspectors. The necessity for these measures has been least felt in the Nellore and Chingleput divisions. Along the remainder of the littoral tracts prevention has been found necessary. In the interior prevention has been found most necessary in the Trichinopoly circle. Operations have been light in the Ceded Districts, where the matter was already attended to before the institution of regular preventive measures. The manufacture of saltpetre, which was formerly productive of considerable injury to the salt revenue, is now only allowed under license, and in some districts, as in Coimbatore, its regulation forms a considerable portion of the work of the preventive force.

610. STATISTICS.—The quantity of salt manufactured, imported and passed into consumption during the past five years is shown in the foot-note.[⁴] Particulars of the price of monopoly salt and of the rate of excise duty in force are also given in the same note. Particulars of imports are shown in the next note.[⁵] The receipts at the commencement of each decade from 1806, when the monopoly was first introduced, have been as shown below.[⁶] Receipts for 1883-84 amounted

to Rupees 138,55,159, but the balance to be collected on account of credit transactions had increased by Rupees 5,24,976, and the collections of duty in Bombay on salt exported to Madras amounted to Rupees 17,09,982 (of which Rupees 1,14,946 were collected in Goa), making the total contribution of the Presidency for the year Rupees 160,90,117. Excluding all expenditure which could not be saved by the Government entirely disconnecting itself from all manufacturing operations and confining itself to the levy of excise and customs duty and prevention, the cost of monopoly salt during 1883-84 was as shown in the next note.^[7] The fluctuations in the Government selling price of salt are shown in the next note.^[8] The price at which it is retailed varies with facilities for communication, but along the coast and for a few miles inland it may be said to sell retail for about from Rupees 2-8-0 to 3-8-0 per maund. Allowing for salt which passes out of the Presidency according to the best information available, the rate of consumption per head, corrected for increase of population, was as follows during the past year:—for the whole Presidency excluding Native States, 15·72 lb.; for the four northern districts, 13·22 lb.; for the West Coast, 17·78 lb.; for the remaining districts, 16·27 lb.

ABKARRY.

611. INTRODUCTION.—The word abkarry ^[1] has been subject to several variations of definition. In parts of Southern India the abkarry tax has within moderately recent times included duties on eating-shops, gaming-houses, and itinerant jugglers. In Mysore the sale of arica or betel-nut was till 1838 included in

[1] SKETCH HISTORY OF ABKARRY IN THE PRESIDENCY.—*Early use of Intoxicants.*—From the most ancient books of the Hindoos, as well as from the hereditary traditions of certain classes, it may be learnt that intoxicating liquors have always been manufactured and used in India. Distillation was practised more than three thousand years ago by the ancient Aryans at any rate. They made an inebriating juice of the Soma or "moonplant," which they employed both for sacrifices and for domestic use. The Soma drink was made from the juice of a creeper (*Sarcostemma viminalis*), diluted with water, mixed with barley meal, clarified butter, and the meal of wild rice, and fermented in a jar for nine days. The starchy substance of the meal supplied the material for the vinous fermentation, and the Soma juice played the part of hops in beer. Its effects were those of alcohol. In the Institutes of Menoo regulations for the classes of distillers and vendors of spirits are laid down with much particularity. So again there can be no doubt that from time immemorial the Dravidians and aboriginal races have largely distilled or fermented strong drink from the coco nut, sago, date, and palmyra palms; from sugar and rice; and in the forests from the dried flowers of the Mohwa or *Bassia latifolia*. That the early European navigators brought with them the custom of drinking intoxicating liquors cannot be disputed. Canter Visseher, writing about A.D. 1723, says that "for strong drink in general the Portuguese have no taste; the Dutch, on the contrary, drink to such an extent as to expose themselves to the reproaches of the Portuguese and the natives; the English are liable to the same imputation." But the addition thus made to the natural habits of the people must have been very slight. The manufacture and use of intoxicating liquors is quite indigenous. Bartolomeo speaks of an attempt of the Rajah of Travancore in 1787 to prohibit the use of cocoanut brandy under pain of the confiscation of property; and the smoking of ganja hemp and use of opium were at the same time forbidden. Tippoo Sultan of Mysore issued a mandate that all the palm trees from which toddy was extracted should be cut down. These measures could not, however, have been long maintained when so large a proportion of the people used the liquors and drugs, or were

the abkarry contracts, and similarly that of tobacco as late as 1850. Even at the present day it is not unusual to define abkarry in Southern India as including the taxes raised on various intoxicating drugs, such as opium, ganja and bhang. The term will be taken for the purposes of this article to mean merely the revenue

dependent on the profits of their manufacture and sale. It may be added to these reflections that native stimulants are probably more injurious in their effects than European liquors.—(2) *Abkarry revenue under Hindoo and Mahomedan Governments.*—The practice of deriving a revenue from a tax upon the sale of intoxicating liquors appears to have been a very ancient one among Hindoo Governments, and the Institutes of Menu above mentioned point to an excise duty upon liquors and other articles, as a proper mode of raising funds for the purposes of government. The Khammary or tax upon the sale of intoxicating liquors, will be found in the list of taxes which were remitted by the emperor Akbar. (3) *First measures by British in Southern India.*—In the earlier years of the century considerable discussion took place as to the best mode of raising a revenue from spirituous and fermented liquors in this Presidency, and various regulations on the subject were framed and considered. In 1803 the Government referred to the Board of Revenue a regulation prepared for the Bengal Presidency, under which it was proposed to levy the tax on the sale of arrack, or country-made spirits, as a daily duty upon stills, at rates varying with reference to the ascertained sizes of the stills. This system is now known as the "outstill" or "monthly tax" system, the daily rate being merged into a monthly payment. The Board of Revenue did not consider the plan suitable to Madras, where the practice of letting, in farm, the exclusive privilege of manufacturing and selling spirituous and fermented liquors in a district or sub-division was generally in force, and they proposed an alternative regulation for the taxation of arrack, toddy, and foreign spirits under the latter mode of management. They reported to Government that there would be difficulty in inducing people to take out licenses for single stills, and that the farming system had the effect of inducing more respectable people to embark in the spirit trade, as the magnitude of the operations in a large farm necessarily involved the possession of capital and some administrative capacity. In reply to some objections made to their proposals, which also included the taxation of toddy or fermented palm-juice, betel and tobacco, they urged that the levy of an assessment upon these three articles as well as upon spirits was warranted by the common law of the country. In two despatches received from the Home Government in 1805 and 1806 on the subject of the Board's proposals, strong objections were taken to "the principle of farming out to individuals any article of taxable consumption," and the direct management of the revenue derived from arrack and toddy was urged upon the local Government. These observations were referred to the Board of Revenue, who acknowledged the justice of the Court of Directors' objections to farming the revenue on general principles, but considered that they rather applied "to articles of general consumption and evident necessity, and not to the renting, as in the present case, under restrictions, an article of luxury by no means necessary, nay even detrimental to the public weal." They also explained that their object was to "restrain and regulate" the consumption of spirituous and fermented liquors, and observed that such a course was in accordance with the immemorial practice of Asiatic Governments, which in some cases, Mysore for instance, had gone so far as to entirely prohibit the use of intoxicating drinks. They considered that the system of detailed licenses (the outstill or monthly tax system), as being contrary to custom and therefore distasteful to the old renters, was less likely to produce revenue than the farming system, but they urged that the health and good order of the people were of far more importance than the augmentation of the revenue, and that undoubtedly these objects would be more surely promoted by a system which insured the employment of respectable persons, rather than one which would place the entire liquor trade in the hands of petty distillers and shop-keepers, whose irregularities it would be impossible to control, and from whom the punctual realization of the revenue would be by no means easy. These opinions of the Board were very nearly identical with those expressed by Sir Thomas (then Colonel) Munro, Collector of the Ceded Districts, in a letter subsequently addressed to them on the subject. (4) *First Regulation.*—Eventually the Government acceded to the Board's views, and early in 1808 a Regulation, Madras No. 1 of 1808, was passed mainly in the sense desired, though, owing to doubts in regard to the propriety of taxing toddy, the operation of the enactment was restricted to the manufacture and sale of arrack and the sale of foreign spirits. The regulation provided that the annual rent of the exclusive privilege of selling foreign spirits and of manufacturing and selling arrack should be farmed; and that the places where distillation and sale should take place, as well as the retail prices at which the liquors should be sold, should be determined by the Collectors of districts in communication with the Board of Revenue. In addition to this system of management, Section 17 of the Regulation authorized the licensing of separate stills as an alternative mode, and when the Regulation was sent to the Collectors of districts they were recommended to make a trial of both plans of management. The licensing or outstill system however was adopted in Nellore, South Arcot and Trichinopoly only, and there merely for a few years; in 1815-16 the renting system was again in force throughout the Presidency, except within the abkarry limits of the town of Madras, where the arrangements were special. The rents, as a rule, included in practice the exclusive privilege of the sale of fermented toddy as well as of that of arrack; there was no legal sanction however for this course, and therefore, as might have been expected, difficulties arose in regard to the realization of the former portion of the revenue. The regulation was also found to be defective, as providing no legal punishment for breach of license. (5) *Second Regulation.*—The amendment of the regulation was finally resolved upon in 1819, and in the following year, Madras No. 1 of 1820 was enacted, which rescinded No. 1 of 1808, and brought under a regular Government monopoly the tax on "rum, arrack or other fermented liquors," providing that the exclusive manufacture and sale of these liquors should either be retained under the direct management of Government, or be rented out by them to farmers. The new regulation permitted renters to sub-rent their farms and to recover their dues from the under-renters by summary process. Special provisions against the use of noxious ingredients in the manufacture of spirits and against irregularities in the liquor shops were introduced in this enactment. It also gave powers to the Board of Revenue to frame rules from time to time as occasion might require, for regulating the sale of all spirits whether country or foreign, and of toddy or other fermented liquors; for determining the places at which stills and shops should be erected, the retail rates of sale to be established, and the measures to be used; and generally for regulating matters relating to the detailed management and control of distilleries and shops. Passes were required under the regulation for liquor in transit in excess of one seer or bottle. In 1841 the question whether a higher rate of taxation could not be imposed on arrack and toddy was considered, but the proposal was eventually abandoned, the district officers being merely enjoined to see that no liquor was sold below the minimum prices prescribed. (6) *Madras Town Act.*—The special abkarry of the town of Madras was provided for in 1852 by a special enactment, India Act XIX of 1852, which arranged for the direct management of the revenue by the Collector of Madras under the orders of the Board of Revenue. (7) *General Act of 1864 and its amendment in 1879.*—The abkarry revenue of the mofussil was managed under the old Act of 1820 for forty-four years, or until the present Abkarry Act, Madras No. III of 1864, became law. The immediate cause of the enactment of the Abkarry law of 1864 was a ruling of the late Sudder Court to the effect that foreign imported wines or beer did not come within the scope of Regulation I of 1820. This difficulty was met in the new enactment, and a few other amendments of the law were at the same time made. Among other things, powers were taken to levy the tax on spirits as an excise duty on the quantity manufactured; to abolish the farming system and to throw open the manufacture and sale of intoxicants subject to the payment of fees or an excise duty on the quantity manufactured or sold; and to suppress the home manufacture of toddy where the privilege was abused or where it was likely to be used as a cloak for illicit sales. Act III of 1864 was amended by Act V of 1879. The amendments were principally in the direction of more stringent measures, for the repression of illicit distillation by rendering the mere possession of implements of manufacture and illicit liquor a penal offence, and the enlargement of the powers of the police and heads of villages for the detection of offences connected with the Abkarry law; increased facilities were given to sub-renters for the recovery of their dues from shopkeepers, and the Board were empowered to prohibit sub-renting altogether where such a step might seem

derived from the manufacture and sale of intoxicating liquors. Its literal meaning is manufacture of waters, that is to say of strong waters. The principles recognized by the Hindoo Governments of Southern India in the administration of this branch of revenue are not ascertainable. In the extreme south, native rule has always

desirable. The Act also empowered the Government to exclude by notification the tract known as the "outside limits" round Madras from the operation of India Act XIX of 1852, so as to enable this tract to be annexed to the Chingleput form. (8) *Experimental Excise system of administration.*—The Experimental Excise system of administration, as it has been termed, originated in 1869 in the Ganjam District. The Collector reported that the abkarry rental of that district had fallen to Rupees 68,980, and that the renters were known to make large fortunes, "the leading merchants combining, it was believed, to keep down the biddings on condition of all sharing in the profits." He added that Mr. Minchin, Manager of the Aska Sugar Factory, who desired to take the abkarry rent of the district on a new system, estimated (as he thought moderately) the total value of the liquor consumed in the district at Rupees 3,41,000, of which, under the system of management which Mr. Minchin proposed, the Government might be expected to realize about half as excise revenue. Mr. Minchin accordingly, on this recommendation, supported by the Board of Revenue, became the renter of the exclusive privilege of manufacturing and selling country spirits in the district for three years, on payment, instead of a fixed rent, of an excise duty fixed at the following rates on all spirits issued from his distillery, viz., spirit 60° under proof, Rupees 0.12-0 per gallon; spirit 30° under proof, Rupees 1.8-0 per gallon; proof spirit, Rupees 2 per gallon. Mr. Minchin was to pay the cost of the Government excise establishment to be placed in charge of his distillery, and was to be allowed 5 per cent. for ullage and wastage of spirits. He was also to sublet the toddy of the district in farms, paying to Government half the amount of his sub-rents. Neither Mr. Minchin's nor the Collector's expectations as to the recovery of the abkarry revenue of the district were realized. Notwithstanding the financial failure however of the experiment, the Board of Revenue, after it had been three years in operation, did not consider its results unsatisfactory. There had been no loss of revenue as compared to that obtained in the year before its adoption, the people had been supplied with good liquor, the revenue had been punctually realized without trouble or anxiety, and there was every expectation that in future years it would improve. When alluding to a proposal made by Messrs. Parry and Company in 1872 to hold the South Arcot District on somewhat similar terms, the Board further expressed themselves as follows:—"the Board are strongly of opinion that the excise system, when trustworthy distillers can be found, as in the present case, is far preferable to farming out the monopoly by public competition, because the actual consumption of spirits in the district is now ascertained in this way, and competition constantly results in such reckless bidding that the renters have to exhaust all possible devices to get a large amount of liquor sold and to importune the Board for frequent remissions, whilst they are often ruined in spite of all, and the security of the revenue is a matter of unceasing anxiety. The comparative advantages of the excise system are so patent that the Board think it well worth while to run a small financial risk in order to obtain them." Eventually the Government authorized the Ganjam and Vizagapatam Districts to be rented for three years to Mr. Minchin, the South Arcot District to Messrs. Parry and Company, the North Arcot District to Messrs. Corbet and Company, and the Chingleput District to Mr. T. Pritchard, on the new system. The rates of duty for Ganjam and Vizagapatam were fixed at the same figures as those in Mr. Minchin's first contract, but he was required to pay over to Government 75 per cent. of his toddy rents instead of 50 per cent. In North Arcot, South Arcot, and Chingleput the excise duty was fixed at Rupees 1.12-0 per gallon for spirits 30° under proof, and it was settled that if it appeared that the sums to be paid to Government by the renters in any year would be likely to fall short of certain minimum amounts, it should be open to the Government to cancel the lease by giving three months' notice. The "experimental excise system" may be thus summarized. It gave the monopoly of manufacture and sale in a district to one person or firm who paid a fixed excise on each gallon of spirits leaving the distillery, and sold it under the regulations and restriction as to number of shops, minimum price, &c., of the farming system, with the further precaution that dilution was not allowed. This system was better than the farming system, in that it gave Government the means of ascertaining the exact quantity of spirit consumed, and because the quantity consumed being taxed at so much a gallon the inducement to fresh consumption was lessened. The system was unsuited to parts of the country which were so thinly populated and inaccessible that spirits which had paid a reasonable excise at a distant distillery could not be carried into them and sold at a remunerative rate. From the returns made it appeared that the cost of making and distributing arrack varied as follows under this system. For spirit 30° under proof:—Ganjam, Rupees 1.3-2 per gallon; Vizagapatam, Rupees 1.5-2 per gallon; Chingleput, Rupees 0.13-9 per gallon; South Arcot, Rupees 1.1-3 per gallon. For spirit 20° under proof:—North Arcot, Rupees 1.2-0½ per gallon. Excluding the excise duty then Rupees 1.4-0 per gallon in the Northern Districts and Rupees 1.2-0 per gallon in the Southern Districts—other than North Arcot—was the lowest rate at which it would pay the distiller to sell; and, allowing a minimum of two annas a gallon for the retail profits which went to the salesman, the minimum retail price to the public might be taken as Rupees 1.6-0 in the Northern Districts and Rupees 1.4-0 in the Southern Districts (except North Arcot), plus the excise. In North Arcot, where the spirits were 20° under proof, the minimum price might be taken as at Rupees 1.5-0, plus the excise. The average retail prices actually charged after the duty had been paid were Rupees 3.11-4 in Chingleput and Rupees 4.4-0 in North Arcot, out of which the distiller obtained a profit of about Rupee 1 in the former case and Rupees 1.2-0 in the latter. (9) *Second Excise system of administration.*—The Board of Revenue subsequently made a recommendation to Government, that what may be termed "the second or improved excise system" should be introduced into the Ganjam, Vizagapatam, Chingleput, North Arcot, South Arcot, Nellore, Salem, Trichinopoly, and Neilgherry districts on contracts extending to three years, from the 1st July 1875, and that an improved farming system should also be adopted in the other districts of the Presidency. The Government sanctioned these proposals, and, after some discussion, the districts of Coimbatore and Tanjore and the town of Bellary were added to the list of those into which the new excise system was to be introduced. It was also settled that the toddy farms should in these cases be separated from the arrack contracts. The main differences between the improved excise system and the experimental excise system were:—"a" that under the former the duty on spirits was fixed with reference to the actual selling price of spirits in the districts concerned, instead of being an arbitrary rate; "b" that the contractors were not permitted to sell spirits beyond a fixed maximum price, in order to prevent their securing to themselves a large profit on a small and easily-managed consumption to the detriment of the excise duty, and the neglect of the supply of outlying tracts of country; and "c" that a minimum guaranteed revenue for each district was arrived at by tenders in the open market, so that a public estimate might be occasionally obtained of that normal consumption of spirits in each locality upon which the State is entitled to levy its excise. The improved farming system required that all spirits should be sold at certain specified strengths, and at retail rates between certain specified minima and maxima. It also provided, as far as possible, for the manufacture of all spirits at central distilleries, subject to Government inspection and control. (10) *General view of the recent Excise system.*—The excise system till quite recently prevailing, and arrived at by the steps above detailed, may be thus summarized. The monopoly both of manufacture and of sale in each district was assigned to a single contractor, who had to pay duty at a certain rate on each gallon issued from the distillery, and who further guaranteed to Government a certain revenue settled by competitive tenders. Maximum and minimum prices were fixed within which the contractor's licensees in the shops were bound to sell to consumers. The range of price permitted was 8 annas per gallon. There was a surcharge of duty at 8 annas a gallon payable on spirits sold in municipal towns; and for such spirits maximum and minimum prices were allowed in excess of the ordinary rates by 8 annas a gallon. Higher prices being possible in the towns than in rural tracts, higher duty was thus obtained. The imposition of a maximum price was intended to prevent the contractors from seeking to obtain all their profits by enhancing prices in the towns, and to give them an interest in affording proper facilities of supply to, and preventing illicit supply in, outlying tracts. The work of prevention of illicit consumption was supposed to be provided for by the contractors. In adjusting the maximum and

been tolerant of the use of spirituous liquors, but the revenue raised by it was not in former days considerable. The old Hindoo Governments manufactured and sold ardent spirits themselves, and kept the sale of fermented palm-juice under their own immediate supervision. The excise administration of England has not much

minimum prices, which were fixed by Government, allowance was made for cost of spirits, excise duty, cost of distribution within the district, charge for administration and prevention, and profits of renter and retailers. The leases were for periods of three years. This, it will be observed, was a system of large monopolies artificially regulated. In its favor is to be said that it was superior to the absolute farming system, which it superseded and under which knowledge of the consumption and regulation of the taxation were unattainable; that it led to concentration of manufacture and the use therein of improved appliances and cheaper methods; that the use of unwholesome materials in manufacture became impossible; and that the revenue was got in without risk or difficulty. In other respects, it failed to secure the advantages expected from it. The renters did not give adequate facilities for supply in outlying tracts, and closed a large number of shops previously existing; they almost invariably charged the highest price allowed under their contracts; they reduced the profits of the retailers to such an extent that these dealers were forced to seek remuneration in illicit practices, which in such hands are specially dangerous to the revenue and difficult to detect; they did little for prevention; and they looked entirely to their own profits and not at all to the interests of Government as hoped. The guarantee system also broke down. It was anticipated that the guarantees which were to operate as a stimulus to the renters to work for revenue as well as for their own profit, would be settled by competition and ensure good management; but the large firms and capitalists who alone can embark in the business did not bid against each other. The guaranteed revenues consequently became so low that the duty was practically paid on quantities issued, which the monopolists were scarcely concerned to extend. According to the accounts furnished by the renters themselves, their profits for the year 1883-84 were 21.47 per cent. on the arrack revenue realized by Government in the excise districts. (11) *Changes effected in 1884.*—Under these circumstances the Government resolved on certain changes. The object in view was to raise the taxation on country spirits, which is now in most districts considerably below the import rate, up to that level; such being the maximum attainable. The extent to which this is possible at present varies in different parts of the country with the habits of the people, the price which they can pay, and the facility with which illicit spirits can be made or sold with impunity. In some places, chiefly towns, it is possible at present without inducing illicit manufacture to obtain prices which admit of the import rate of duty being paid; and until this level is attained everywhere, there must be varying rates of price and of taxation. The problem is to devise a system which shall allow of sufficient range of rates, while affording reasonable security that the highest possible rates shall be reached in each locality. This requirement is satisfied by the system now adopted. The taxation on spirits is divided into two parts, one fixed and one fluctuating. The first is taken in the shape of fixed duty, when the spirits leave the distillery; the second in the shape of a lump sum for the privilege of vend in the locality such lump sum being fixed by public auction. The holder of the privilege will raise the price if he can; and, if successful, competition will at the next auction convert his profits into duty payable to Government. The proportion which the fixed bears to the variable taxation is now evidently too low; but it is hoped that this will be corrected when the next contracts are entered into. The next change of importance which has been effected is the separate disposal of the privileges of manufacture and sale, which under the old excise system were granted in one monopoly. The concentration of the manufacture has been retained. The whole of the spirit required for each district is still made at some large distillery which, as a rule, is within the district limits. In some cases however the manufacturers deliver liquor made elsewhere at a central dépôt in the district where it is excised and issued to the vendors. Except in some special localities the vendors pay Rupees 2 per gallon on removing the spirits; and the supply monopoly is given to the tenderer who, by making the spirits most cheaply, is able to offer to Government the highest share out of this charge. The above remarks apply only to those districts in which the monopoly of the privilege of supply is still granted. In a few localities, however, what is known as the "free-supply" system has been started as an experiment. Its essence is that all licensed distillers are allowed to compete for the custom of the vend monopolists, who can supply themselves where they please, paying to Government a fixed sum per gallon. This system promises to be so successful that it will probably be largely extended on the conclusion of the current contracts. There has been ample competition, and the system promises a solution of the difficulty attending monopolies of supply, viz., that of adapting the spirits to the consumers' tastes. It should also foster scientific manufacture, as such will, by superior cheapness, beat country stills out of the field. The distilleries will still be under complete supervision, while the cheaper manufacture will advantage Government by leaving a larger margin out of the price for Government duty. In regard to sale, the reforms introduced have been devised with a view of getting rid eventually of the monopoly middlemen and of exclusive privileges, so far as the abolition of such privileges is consistent with the maintenance of restriction on the number of shops. It is not possible to abolish middlemen all at once, and the first step in the transition from the large district monopolies to single shop rents was obviously to reduce the size of the areas in which the privilege of vend is assigned. Accordingly the exclusive privilege of sale has been disposed of by auction, generally by talooks, but in certain tracts where the shop sales were large and where the class of shopkeepers was more intelligent and substantial, the shops have been sold separately and the shopkeepers left to supply themselves from the competing distilleries in the free-supply tracts, and from the talook vendors (who are bound to supply within a fixed, maximum price) in other places. The reduction in size of the sale monopolies should benefit the revenue, as it admits to the business a class of smaller capitalists among whom a really sound competition can be set up, instead of the often false competition under which the district monopolies of supply and sale were disposed of under the old excise system. These smaller capitalists should do the work more cheaply than the district monopolists, and their employment therefore should leave greater scope for enhancement of duty. They should also, as a rule, be men of greater local knowledge and be more valuable for detection of illicit supply, working as they will for their own interest, than the hired servants of the district renters. Their local knowledge should enable them to form juster estimates of the adequacy of the present supply where the excise renters have allowed the number of shops to be reduced. It is expected that when the current contracts run out, it will be possible to reduce the areas still further, and to dispense with talook vendors in many more places. The attempt to regulate retail prices has been given up, and the adjustment has been left to supply and demand though a minimum price is still prescribed in compliance with the existing law. The present tendency of prices is to enhancement, as the vendors endeavour to raise them as high as they can; but excessive enhancement is not a matter to be regretted for the resulting restriction in the consumption is to the benefit of the people, nor can the price of country spirits advance beyond that at which imported or fully excised spirit can be sold. At the same time, vendors will be able to reduce prices in places where this measure is necessary. Prices may be left to settle themselves, and whatever price is proved to be attainable, Government will get the benefit of it when the contracts are next put up to auction. As to strength, no spirits are allowed to leave the distilleries at more than 20° under proof, without payment of full excise duty, i.e., Rupees 4 per gallon at proof strength or less. Even though such be paid, these spirits are not allowed to be sold except in foreign liquor shops. It is considered unnecessary to interfere with the strength at which spirits are sold in such shops, as even if diluted to enable them to compete with country spirits they will still have paid full proportionate duty. But the case is different as regards country spirits. To prevent them from competing with European spirits, the strength is limited to 20° under proof and under; and the strengths at which they may be sold are fixed at 20°, 30°, and 60° under proof and no others. The object is to free European spirits, which are usually sold at strengths above 20° under proof, and which are, as a rule, consumed by classes well able to pay full duty, from the competition of under-taxed spirits issued and sold at lower strengths; to prevent adulteration and dilution by the shopkeepers; and also in order that means may be available for detecting such practices and (still more important) the sale

analogy with Indian abkarry. In England a large class of vested interests has grown up in advance of action by Government, and though this is checked to a limited extent and an enormous public income is derived therefrom of nearly a third of the Government revenue, the trade is essentially a private one. Legislation on the liquor question in England is mainly concerned with arrangements of a police nature, and general principles are necessarily to a great extent in abeyance. In India the Government has had the advantage of beginning with a monopoly resting in their own hands. Further the amount at stake is much less, in Madras little more at the present day than a twelfth of the annual Government revenue. It has been possible therefore more or less to examine first principles, while proceeding with the administration of the revenue. In this the Indian Governments occupy the same position as has been attained in Sweden by the self-denial of the community; who have voluntarily placed an almost absolute controul over excise in the hands of the Government. Abkarry revenue in India is administered on the following principles; which may be described as consisting of two principles, and two counter-principles. First it is held that the practice to be controuled is a dangerous luxury, therefore its regulation is a legitimate function of the Government, especially when they find it already placed in their hands by the traditions of the country. Secondly the most efficient way to regulate the practice is to take steps for raising a revenue upon it, as taxation is that which most intimately

in the shops of illicitly-made spirits. Nearly all the shopkeepers know how to distil; but with the rude appliances which alone they can command they can hardly make the higher strengths 20° and 30° under proof at all, and they cannot regulate the strength with sufficient accuracy to escape detection. If it were certain that illicit distillation were absolutely impossible, the regulation of strength might perhaps be dispensed with. The last change of consequence is the reduction of the period for which the exclusive privileges are to run. It used to be three years; in 1884 the period was made eighteen months so as to conclude with the official year 1885-86, but thereafter the contracts are to be annual. The object in view is to enable Government to bring into operation and speedily to benefit by any improvements in the system which experience may suggest, and to expedite the process of levelling up the taxation on country spirits to the import rate. It was thought that the shortness of the period would prevent adequate bids at the auctions; but it seems that with small contracts, such as those for talooks and shops, a year is long enough. Such at least is the conclusion to be drawn from the sales (for a year only) of the toddy and rented arrack houses which in 1884 produced an increase of 5½ lakhs or more than twenty per cent; of the arrack contracts then disposed of which sold for eighteen months at an increased revenue of nearly 11 lakhs a-year or about fifty per cent.; and of the toddy and rented arrack farms sold in 1885 and from which an increase is expected of about seven lakhs or about twenty per cent. upon the large increase already secured in 1881, only a year before. (12) *Changes now imminent in the law.* A Bill for the consolidation and amendment of the Abkarry laws is now pending before the local Legislative Council and will shortly be passed. Its principal object is to improve the administration by the appointment of a Commissioner of Abkarry, who will have the full controul of the Abkarry revenue and under whose orders the Collectors of districts and their subordinates will be placed, so far as their duties relate to the Abkarry. For economy's sake, it has been decided that the appointments of Commissioner of Salt and of Abkarry Revenue shall be held by a single officer, and that the preventive action necessary for the protection of the Abkarry shall be entrusted to the preventive agency already entertained throughout the Presidency for the protection of the Salt Revenue. The Bill provides the necessary powers. It also legalises the levy of the toddy revenue by the imposition of a tree-tax and authorises the framing of such rules, to have the force of law, as Government may from time to time find necessary for the regulation of the details of the administration. The object of the Bill is, in short, the improvement of the revenue by the concentration on the subject of the attention of a single responsible officer of standing and experience; by the power, under the rules, of varying its treatment as circumstances may require; and by the substitution for the irregular and imperfect preventive action of the contractors of the uniform and persistent pressure of a highly organized and well paid department of the State. Provision is also made for the regulation and repression by taxation of the use, hitherto quite unrestricted, of such intoxicating drugs as ganja, &c., which are highly injurious both to the moral and to the physical well-being of the people. (13) *Progress of the revenue during the century.*—In the year 1800-1, the amount realized by the abkarry throughout the Presidency was little over two lakhs of rupees, but in 1807-8 it had risen to upwards of six lakhs, and during the following three years it rose to nearly nine lakhs. From that year up to 1832-33, when the revenue stood at upwards of 18 lakhs, there was a steady annual rise except in 1824-25, which was a year of scarcity, and when a check was received which lasted for the five following years. In 1832-33 the average price of unhusked rice of the second sort rose from 66 seers to 45 seers per rupee, and in the following year to 38 seers. During this period occurred a very serious famine in Goontoor and the other northern districts, and the effects were at once visible on the abkarry collections, which fell from 18 lakhs to 16 lakhs, and then to little over 14 lakhs. Though prices fell subsequently to their former rates, the abkarry revenue did not recover till the year 1842-43, when it stood again at a little under 18 lakhs. From this year up to 1855-56, when the revenue touched 22½ lakhs, there was a regular increase, year by year, except in the two years of scarcity, 1846-47 and 1854-55. The abkarry revenue rose from the 22½ lakhs noted above to upwards of 30 lakhs in 1860-61, to nearly 42 lakhs in 1865-66, and to nearly 61 lakhs in 1869-70. In those fourteen years the revenue increased nearly threefold. The greater part of the increase was owing to the enhanced taxation on spirituous and fermented liquors resulting from the keen competition among abkarry farmers at the different auction sales, but it was also due to increased consumption. In 1875-76 the abkarry revenue amounted to 65 lakhs. In the two following years it decreased on the average by nearly fifteen lakhs owing to the famine of 1876-78. In 1878-79 it recovered to nearly 61 lakhs. The actual collections since 1870 have been as under:—

1870-71 (early 1280)	57,05,529	1878-79 (early 1288)	60,88,810
1871-72 (" 1281)	58,75,630	1879-80 (" 1289)	57,52,555
1872-73 (" 1282)	60,27,818	1880-81 (" 1290)	55,63,790
1873-74 (" 1283)	60,71,260	Last nine months of 1881-82	46,01,553
1874-75 (" 1284)	59,36,752	1882-83	59,80,965
1875-76 (" 1285)	65,03,843	1883-84	50,84,123
1876-77 (" 1286)	52,28,535	1884-85	70,41,311
1877-78 (" 1287)	49,52,682				

touches the people. There is in fact no impropriety, subject to considerations hereafter to be mentioned, in the Government aiming at the greatest net gain to themselves which may be realizable. In raising thus the price of the article above its natural trade value, the Government tax the purchasers for the benefit of their fellow citizens; but this is legitimate, considering the nature of the commodity purchased, as above-mentioned. Thirdly however there is the counter-principle that the agency employed by the Government in these measures should not be such as to stimulate the practice while nominally repressing it by taxation. And fourthly there is another counter-principle, that it is useless to push taxation so far as to run the risk of thereby encouraging illicit usages, in other words of smuggling. To follow these last two considerations in all their ramifications is a work of considerable labour and delicacy, and forms the basis of the numerous details involved in the administration of the abkarry revenue. The question of agency in particular, such as shall tax without creating trade, underlies all the Government measures of legislation and administration connected with the subject. To ascertain the limit of excise taxation is also a difficult financial question, involving an examination of the varying conditions to be found in different parts of the country. The use of stimulating and intoxicating liquors arises inevitably out of the increase of wealth and intellectual labour, and there is no reason to suppose that the administration of the Madras Government has on the whole done otherwise than to wait upon and follow the natural propensities of the population. The increase in abkarry revenue in the native-ruled state of Travancore has in the last half century run to a great extent parallel with that in the Madras Presidency.

612. SOURCES OF REVENUE.—The present sources of the abkarry revenue in this Presidency are first the tax upon the manufacture and sale of country-made spirits or arrack; secondly the tax upon the sale of date-toddy, palmyra-toddy, and cocoanut-toddy; thirdly the proceeds of the sale-licenses for the sale of Foreign spirits and wines, and of beer; and fourthly the receipts from fees for manufacturing licenses for the distillation of spirits by the European process, and for the establishment of breweries. The revenue is mainly derived at present from the first two items. The country spirit, which is in most general use throughout the Presidency, is an ardent spirit, transparent and colourless like gin. Though called arrack, it is properly speaking rum, as it is distilled from sugar-cane-jaggery, palmyra-jaggery, date-jaggery and molasses, or from a combination of these substance together with a small quantity of acacia bark. The spirit consumed in every district, except part of Vizagapatam, Godavery, parts of Kistna and Kurnool, Malabar and South Canara is distilled from these ingredients. Ganjam and the Coast talooks of Vizagapatam are at present supplied by Messrs. Minchin Brothers and Co., with rum from their sugar factory at Aska in the former district. In the hill tracts of these two districts however the spirit generally consumed is distilled from "mohwa" flowers, and when they are not procurable from grain. In Godavery, Malabar and South Canara spirits are invariably distilled from toddy, and this is the case generally in the Kistna also and parts of Kurnool. The following are the details of distillation by the native method. When the arrack is distilled from jaggery or unrefined sugar, this is broken up and put in water to ferment together with the bark for four days; then the whole is boiled in an earthen pot, the vapour being caught at the top in a tube of bamboo and carried on so as to fall into another pot, or into some condensing vessel placed in cold water. Distillation is effected in half a day. Sometimes the first product is re-distilled. When the arrack is manufactured from toddy, a quantity of this is taken on the second day after being drawn from the tree and put in a large earthen pot on an oven. On the top of this, a small earthen pan, having three holes at the sides, is placed, and over this a brass pot containing cold water. The edge of the intermediate vessel is tightly secured with cloths so as to retain the vapour, and from a hole in one side a pipe is fixed to convey the spirits into a bottle. The cold water in the upper vessel, which is open to the air and used for condensing, is renewed from time to time as it becomes heated, until distillation is completed. Women generally attend to this work. Ten quarts of toddy will yield about one of proof spirits. The first bottle drawn will be first-rate arrack; the second bottle, second quality. To make the very best arrack, toddy and arrack are mixed together and distilled. The people

believe that it is in order to impart a strong intoxicating quality that the bark of the acacia is added when arrack is made from jaggery; but in reality this is added on account of the tannin it contains, and in order to precipitate the albuminous substances contained in the jaggery. The spirits produced on the East Coast are not considered equal in purity and excellence to those distilled on the West Coast. The preparation of toddy (a Hindostany word) is a familiar process in every Madras village. Throughout the northern districts it is drawn both from the date and from the palmyra palm; in the southern districts and on the west coast from the cocoanut and palmyra. In the hill tracts of the Northern Circars and on the West Coast much toddy is also obtained from the wild sago palm. Date-toddy is the fermented juice of the date palm. The juice is extracted by making an incision in the bark of the trees and letting it exude. It may be taken at any period of the year, but only for three months out of the twelve from each tree. The average produce varies very much in different localities, and this question is being investigated. Date-toddy is largely used in the Bellary District; it is also used in Kurnool, Cuddapah, Godavery, Ganjam and Vizagapatam, the upper portions of Salem and in parts of North Arcot. Palmyra-toddy is another description. This is obtained from the palmyra tree by squeezing the young shoots in a rude apparatus contrived for the purpose, after their ends have been cut off. After eight days of this process the juice begins to exude. The male trees produce toddy from January to April, and the female from February to May. The question of average produce is under investigation. These trees are to be found in almost every district, but they are most plentiful in the southern districts of the Eastern Coast. Cocoanut toddy is obtained from the cocoanut tree by the same process as the palmyra toddy, and the average produce is probably the same. The liquor may be drawn at any period of the year, but not for more than six months out of the twelve from each tree. Cocoanut toddy is very largely in demand in the Tanjore District, in parts of Trichinopoly and in Canara and Malabar, but in other parts of the country it is not a beverage in general use, as the cocoanut groves are not so thickly spread over the country as to make it easily procurable. Toddy ferments after standing for a few hours in the heat of the day; and spoils, turning into sour vinegar, in two or three days. Toddy is also employed for yeast in making wheaten bread and rice cakes. All the beer now made in the Presidency is made from malt and hops, in the same manner as in England. The malt is mostly imported from Europe, the local barley usually yielding a very poor extract. Some malt is however imported from the Punjaub. Foreign liquors need no description. The improvements in the distillation of ordinary arrack have been recently so great, many Europeans being engaged in the process and European machinery being used, that the distinction of 'spirits made on the European process' is at the present day little more than technical for purposes of assessment; see paragraph 616 below. There is a fermented liquor in use in the Jeypore Zemindarry termed sowda which appears to be somewhat similar to the pachiwe or rice-beer of Bengal. It is however made from raggy, not rice. A liquor drug, made from a cold infusion of the roots of *Plumbago Zeylanica* and *Wrightia antidysenterica*, mixed with rice flour and dried, is used to start fermentation. This liquor is included in the rented farms, and is not separately taxed. Methylated spirits for use in manufactures, &c., are prepared in several distilleries, by the usual method of the admixture of one-ninth of wood naphtha (methyl. alcohol) or of one-and-a-half per cent. of caoutchoucine with plain spirits of not less strength than 30° over proof. The duty on spirits used for this purpose is five per cent. ad valorem.

613. LAW.—The right of Government to the revenue from abkarry is reserved under Section 4 of Madras Regulation XXV of 1802. The abkarry revenue in the town and suburbs of Madras is regulated by India Act XIX of 1852. Under Section 2 of India Act III of 1856 abkarry officers are empowered to make arrests in certain cases. The law relating to the abkarry of the Madras Presidency beyond the limits of the Madras abkarry as prescribed by India Act XIX of 1852 is found in Madras Act III of 1864. The whole law regarding abkarry as contained in India Act XIX of 1852 and Madras Act III of 1864 was amended by Madras Act V of 1879. Rules relating to the sale of spirituous and intoxicating liquors in the

town of Madras are contained in Sections 179 to 189 of Madras Act I of 1884, the City of Madras Municipal Act. References to the existing law by subject-headings are given in Vol. II., App. LIV., under the title Abkarry. The rules under these enactments having the force of law are given in the next foot-note.^[2] The whole of the existing laws on the subject of abkarry will probably be repealed by the passing of an Abkarry Bill now before the local Legislative Council.

614. METHODS OF ADMINISTRATION.—The following is a brief description of the different methods for realizing the revenue and simultaneously laying a check on the habits of the people, either now prevailing, or so recently prevailing as to be intimately concerned with the present administration. They will be described as relating to (a) arrack, (b) toddy, (c) miscellaneous items.

615. The arrack abkarry of the town of Madras has always been managed by the Government without the intervention of general farmers, and their relations to the machinery of supply are or have been till quite recently very much the same as those of the abkarry farmers to their subordinates. The Act is India Act XIX of 1852, as amended by Madras Act V of 1879. The area of the Madras Town Abkarry was defined in the first Act as extending eight miles beyond the limits of the town proper or beyond the High Court's original jurisdiction. The tract thus outside the town known as the "outside limits" was intended to interpose between the highly priced and highly taxed liquor consumed in the town and the cheap and more lightly taxed liquor sold in the surrounding district of Chingleput, a belt of country in which the prices and taxation should be lower than in the former and higher than in the latter; so as to diminish the incentive to smuggle liquor into the town. But the taxation of liquor in Chingleput having been in recent years brought more up to the level of the town duty, the continuance of this measure of precaution was found unnecessary and has been abandoned; the tract having been amalgamated with the rest of the Chingleput District. Until April 1, 1885, the arrack system in the town of Madras was as follows. Government retained in its own hands the right of supplying the spirits consumed, which were of two kinds: Colombo arrack, a superior article distilled from cocoanut toddy and imported from Ceylon; and puttay arrack, locally made from jaggery, and so called because of the use of acacia bark in its manufacture. Both kinds of spirit were obtained from contractors and were retailed to the shopkeepers at a profit more than sufficient to cover all expenses, and with a duty more than proportionate according to strength to the tariff rate of import duty on foreign spirits, which latter were therefore pro tanto protected within the limits of the town. Under this arrangement the shop-keepers entered into an engagement called a dowe, whereby they agreed to sell, or at least to pay the duty on, certain quantities of liquor supplied to them daily from the Government stores and to retail them at certain fixed rates, whether custom was forthcoming or not. The object of this provision was to prevent dilution and adulteration, the inducements to which were minimised by the requirement of a fixed daily minimum of sale; and thus to protect the consumer. A very similar system is commonly adopted by abkarry renters in the management of their farms. As it appeared however undesirable that Government should be so closely connected with the traffic in intoxicating liquors, and as the consumers in Madras town are equally well able with those in mofussil districts to protect themselves against the supply of inferior and deleterious beverages, it has now been decided to abolish the entire system; and

[2] RULES HAVING THE FORCE OF LAW.—Under India Act XIX of 1852, Section 6 (Abkarry, Madras town), the following have the force of law:—(1) Section 2, Certain tract excluded as regards the sale of arrack from suburbs of Madras as defined in Section 40—Revenue Notifications, dated 23rd June 1879, published in the Fort St. George Gazette of the 1st July 1879. (2) Section 6, Conditions of licenses for the retail sale of beer, wine, and European spirits in the town of Madras—Notification of Board of Revenue in the Fort St. George Gazette, dated 7th July 1874. (3) Section 6, Forms of licenses for arrack and toddy shops prescribed by the Board of Revenue in 1863 and 1874. Under India Act XVI of 1863, Section 2 (excise on spirits used exclusively in manufactures), the following have the force of law:—(4) Rules—Revenue Board's Standing Order, No. 88. Under Madras Act III of 1864, Sections 6 and 28 (Abkarry Act), the following have the force of law:—(5) Section 5, Revised forms of licenses prescribed by the Board of Revenue in 1881 and 1882. (6) Section 28, Home manufacture of fermented liquor for 'bona fide' domestic consumption declared illegal unless licensed with certain exceptions—Revenue Board's Notification, dated 29th July 1873, in the Fort St. George Gazette, dated 5th August 1873. (7) Exempting Bhadracheliyam and Rekappully Talooks in the Godavery District from the above notification—Revenue Board's Notification in the Fort St. George Gazette, dated 14th July 1874. (8) Rules framed by the Board of Revenue, Standing Orders, Nos. 81—89. Under Madras Act V of 1879 (Abkarry Laws Amendment Act), the following has the force of law:—(9) Revenue Notification bringing the Act into operation from the 23rd June 1879, published in the Fort St. George Gazette of the 1st July 1879.

as a first step the annual sale by auction of the right to hold shop licenses has been substituted for the dowle system. The supply of spirits is still in the hands of Government, but the shop-keepers are left to buy as much or as little as they require and to sell at such prices as they please; and on the expiry on March 31, 1886, of the current contracts for the supply of arrack, Government will withdraw altogether from concern with the business and will leave the licensed vendors to procure their supplies as may best suit them under the free-supply system. In the Jeypore country belonging to the Vizagapatam District also, with the exception of Koraputt, Hill Pachipenta and Hill Madgole, which are rented out, the Government deals directly with shop-keepers. Prior to 1868, the whole of Jeypore was rented out, but in consequence of grave irregularities and illegal exactions on the part of the renter, it was determined to discontinue the renting system. Liquor is now manufactured and sold by persons specially licensed for the purpose in consideration of an annual payment. The liquor is manufactured from rice, raggy, and the mohwa flower. In certain parts of the country and under certain circumstances the Government can exercise no controul over the liquor trade except by managing it themselves. It is not the desire of Government however to keep it in their own hands more than is absolutely necessary.

616. The farming method for arrack may have many forms. The form most usual in this Presidency gives the exclusive privilege of both manufacture and sale within defined tracts to the contractors. The contracts under this system are disposed of for a fixed period, usually a term of years, at open auction sale. The contractors almost invariably sublet their contracts at a profit. Sometimes however they adopt the system of apportioning the outside villages among a number of sub-renters and of retaining the principal town of the tract in their own hands. Occasionally they deal directly with shop-keepers in each village. In certain cases the contractors have been required by Government to manage a particular talook or town themselves, a limited number of stills only being allowed with a view to preparing the way for the introduction of the excise system. About 1859-60 the farms were placed in the hands of large capitalists by selling entire districts; after ten years' trial however the former system of talook farms was reverted to, and this still obtains in the non-excise districts. The contractors make their own arrangements for obtaining material. They are bound to keep accounts of receipts and disbursements, and of manufacture and issue of liquor, which are open to examination by the officers of Government; to sell liquor only at the prescribed strengths, and at prices between certain maximum and minimum limits; to use proper measures; and to allow inspection of premises by officers of Government. The monopoly is subject to the condition that liquor manufactured by any other person on the European process may be excised by the Government and brought into the market for sale on payment of the import rate of duty prescribed for similar articles. The farming method prevails at the present day in the Godavery, Kistna, Malabar and South Canara Districts; and in parts of the Vizagapatam and Kurnool Districts. The statistical and administrative controul given by the farming method is however insufficient for the purposes of Government. There is no certainty as to the quantities of liquor sold, and no controul over strength or prices. The excise system is therefore to be preferred, even though it may at first lead to some loss of revenue. Formerly the toddy farms were for convenience combined in every case with the arrack farms, and this is still so in all the districts specified above except Vizagapatam. The arrack and toddy interests however being separate and in some particulars opposed, it is held to be more advantageous to entrust them to separate persons, and that is now being done. A difficulty in the way of separation occurs only in those parts of the country where arrack is made from toddy, and the details of the two administrations are thus intermixed.

617. The excise method for arrack, briefly stated, differs from the farming method as follows. The manufacture of spirits is restricted to one, or at most two, distilleries. At these a Government gauging establishment is maintained; and the revenue is levied by a still-head duty on the quantity actually passed out for consumption, instead of by a lump payment calculated irrespectively of the quantity of spirits consumed. Under the farming system the farmer has always the mono-

poly both of supply and of vend. Under the excise system, the two monopolies are disposed of separately; though the same contractor may take up both. The steps by which this position has been reached will have been seen in the sketch history. As worked at the present date, the system presents the following varieties. In the South Arcot District, the monopoly both of the supply and of the vend of country spirits is held by a single firm. In the rest of the excise districts, except what are known as the "free-supply" districts, the monopolies of supply and vend are separated; the former being held by single persons or firms for the whole district, and the latter having been sold by auction, generally by the talook, but in a few instances by the shop. In the "free-supply" districts (Chingleput, Trichinopoly, Bellary town, and part of Kurnool), while the vend monopolies have been similarly disposed of, the vend monopolists have been left free to procure their supplies whence they please, subject to the payment of duty on the quantity which they purchase.

618. In the town of Madras the Government directly administer the toddy revenue, as they formerly did the arrack revenue. In this case however they do not supply the liquor to the shop-keepers. The shop-keepers obtain it themselves, under certain conditions imposed to ensure the Government revenue. Having first taken a license from Government they enter into private engagements with the owners of gardens to draw toddy from the trees situated in those gardens. The Government officers are provided with a list of the gardens and trees which the shop-keeper thus proposes to utilize, and to make sure that no others are used they stamp the trees themselves with marks indicating the season for which toddy is to be drawn. When the shop-keeper has decided on the number of trees which he wishes to utilize, the Government fix a corresponding sum which he must pay daily, as dowe or duty. As a rule the number of trees employed by a particular shop is constant, and the shops are arranged in four classes indicating the ordinary number of trees assigned to them. When extra trees are desired by the shop-keeper, these are allowed to be used at fixed rates, or on extra dowe as it is called. Toddy cannot be extracted from any tree until it has been stamped and registered by the abkarry officers. Besides the permanent shops for the sale of cocoanut-toddy, from 100 to 120 shops for the sale of palmyra-toddy are opened in the three months when the palmyra trees yield. In Jeypore also there is a direct or amanu management of toddy. The toddy in Jeypore is drawn from the sago and date palms.

619. In every other case but those mentioned in the last paragraph the toddy revenue is managed exclusively on the farming system, the rents being put up to public auction and the revenue being thence derived. The domestic manufacture of toddy except in the border mountains of South Canara and the agency tracts of Ganjam and Vizagapatam is forbidden under Section 28 of Act III of 1864. The particulars of the connection between the arrack and toddy farms have been mentioned above. The toddy-renters obtain toddy from palm trees on Government waste land free of payment, but they must make their own arrangements with the owners of puttah or inam lands for the use of trees standing thereon. It is in contemplation to abolish the toddy-farming system and to substitute for it a system of tree tax analogous to that in force in Madras town. The design is thus to raise the toddy revenue in the course of time to an amount at least approximately corresponding to the alcoholic strength of the toddy itself, and to diminish the incitements to drunkenness which are now caused by the extreme cheapness of the beverage as compared with arrack.

620. A small revenue is derived from license fees for the retail vend of foreign spirits and wines and of beer. The fees charged for licenses for Hotels and Refreshment Rooms vary from Rupees 300 to 50 per annum, according to the locality and the estimated scale of the transactions. That for wholesale licenses is Rupees 25 per annum in the mofussil. No license is at present required for wholesale vend in the town of Madras. The fees charged for retail licenses (not to be drunk on the premises) are Rupees 100 per annum in Madras, and Rupees 50 per annum in the mofussil. Retail licenses for the sale of foreign spirits, &c., to be drunk on the premises are put up to auction annually, at upset prices of Rupees 50 per annum in

Madras and of Rupees 15 per annum in the mofussil. The fee for a license to distil spirits by the European process is Rupees 100. Licenses for the sale of foreign spirits, &c., include the right to sell country beer. Previous to 1872 a revenue was derived from country-brewed beer in the shape of license fees for manufacture and retail vend; in that year a duty of 1 anna per gallon was substituted for the brewing license fee. No restriction as to the places at which brewing might be carried on was imposed till 1875; but as the liquor sold under this name was found to contain noxious ingredients and was unwholesome, the permission to brew on the plains was withdrawn, the rate of excise was raised to 4 annas a gallon, and brewing was restricted to beer made of malt, hops and sugar only, the proportion of sugar and hops to be used in the manufacture being defined, and the alcoholic strength limited to 8 per cent. Recently in order to place country-brewed beer on an equality with imported beer, which was formerly protected, the duty has been reduced to the original rate of 1 anna per gallon, which is the same as the import duty. From the arrangements here, most of which came into force only from April 1, 1885, a miscellaneous abkarry revenue of about Rupees 35,000 per annum is expected.

621. CONSTITUTION OF DEPARTMENT.—It has recently been arranged that the supervision of Abkarry shall be transferred to the Salt Department, so that full advantage may be taken of the preventive agency, maintained by that department throughout the greater part of the Presidency for the protection of the Salt Revenue. The head of the Salt Department is now denominated Commissioner of Salt and Abkarry Revenue, and the department is in course of being strengthened by the addition of a sufficient number of Assistant Inspectors for the allotment of one officer of that class to the charge of each distillery; and by the formation of additional circles, each under the charge of an Inspector, for the due conduct of preventive action in those tracts to which the operations of the Salt Department proper were not extended. The number of Assistant Commissioners has also been increased by one, so as to provide better supervision in the districts hitherto included in the Central Division.

622. STATISTICS.—Some remarks as to the progress of the Abkarry Revenue during the present century and a statement of the yearly collections since 1870 have been given in the sketch history. The statements at foot [3 & 4] show the

OPIUM.

623. INTRODUCTION.—Opium is the dried juice of the unripe capsules of a species of poppy. The poppy plant is described botanically as an annual varying in height from one to six feet, erect, branched, of a glaucous green colour, with ovate-oblong sessile leaves, the stem and leaves generally smooth, the branches terminated by large flowers on long stalks, the capsules globose or roundish-ovate and smooth. There are two varieties of the plant, the *papaver somniferum* with red flowers and black seeds, and the *papaver officinale* with white flowers and white seeds. The former is grown on the Himalayas, but the opium of commerce is mostly manufactured from the *papaver officinale*. The juice is obtained as the plant stands by making incisions in the capsules and allowing it to exude. It is then inspissated or thickened by atmospheric evaporation, and finally made up into hard balls or cakes. The cultivation and preparation of opium forms a precarious industry. Opium is not largely consumed in any European country, ardent spirits being rather resorted to. Asiatic countries on the contrary, especially China, Burmah, the Straits Settlements, and the islands of the Eastern Archipelago, employ it in preference to any other narcotic or stimulant. It is stated that excess in the use of opium is less injurious than excess in the use of spirituous liquors; while on the other hand its moderate use after the age of 40 prevents waste of tissue, prolongs life, and makes the system less amenable to the influences of malarial and other poisons which vitiate the atmosphere of tropical countries. The usual process of preparing for actual use in the smoker's pipe is to mix the raw opium with the ashes of the previously half-consumed opium, to make an infusion of this in water; and then to evaporate the infusion to the consistence of a thin extract, which is put in the pipe and smoked by incandescence. It is however also prepared and smoked in the form of solid pills about the size of a pea. Opium is grown in China, Asiatic Turkey, Egypt, Persia, and India. The Indian drug is the most esteemed, and fetches the highest price. The best Indian opium is that made in a large tract on the Ganges, about 600 miles in length and 200 miles in breadth. This tract is divided for administrative purposes into two agencies, Behar and Benares; the central factory of the former being at Patna, and that of the latter being at Ghazeepore in the division of Benares. The opium of this tract is called Bengal opium. The cultivation there is a Government monopoly, no person being allowed to grow the poppy except on account of Government. Annual engagements are entered into with the cultivators to sow a certain quantity of land, and to deliver the whole produce to Government at a fixed rate varying with quality. The engagement is confirmed by an advance of money. It is optional on the part of the cultivator to enter into this agreement, or to employ

* 25° under proof.

his land otherwise. Manufacture for Government then takes place at Patna and Ghazeepero. Sale of the balls or cakes, the property of Government, takes place by auction. Merchants purchase, and with scarcely any deduction export via Calcutta to China and the other foreign markets. The number of chests of Bengal opium sold annually is about 56,000; realizing about 700 lakhs of rupees, of which two-thirds may be said to be revenue to Government. Hong Kong [1] takes about two-thirds of the total exports of the Bengal article, and the Straits Settlements about one-sixth. A small quantity comes to Ceylon. The native states of Central India grow a somewhat inferior opium, which is there cultivated free. It cannot however pass into British territory, and consequently cannot reach the sea for export, without paying a special duty to the British Government. This is called Malwah opium. It has an intrinsic advantage over Bengal opium in being more easily prepared for smoking. From a chest of Bengal opium containing 100 catties only 56 to 60 of prepared opium is obtainable, while from a similar chest of Malwah opium 70 to 76 catties can be had. Bengal opium requires 36 hours to prepare for the pipe, but Malwah can be prepared in a few hours. Malwah opium is made in flat circular cakes, of an average weight of $1\frac{1}{2}$ lb. of a rusty brown colour with a strong odour, and with a bitter permanent taste. It is much adulterated. Bombay exports to China nearly 40,000 chests of opium annually, the revenue to Government from duty being almost identical with that in Bengal from sales. The proportion retained in Bombay Presidency for home consumption is fractional. This Presidency is not the channel of export for opium to any exterior foreign country. It however imports from Malwah direct a small quantity for its own home consumption and that of adjoining native states and foreign settlements in Southern India. Opium is chiefly consumed in the northern districts, viz., Ganjam, Vizagapatam, Godavery, and Kistna. The classes that smoke it are the Ooriyahs, the hill-men generally, and the lower classes of Mahomedans. The Hindoos, excepting those who have come from northern parts of India, do not use it to an appreciable extent except as a medicinal preparation. The receipts in this Presidency are (a) the pass duty on opium imported into the Presidency, paid at Indore but credited to this Government, (b) the proceeds of the sale at public auction of the farms for the retail vend of opium, and the manufacture and vend of intoxicating drugs prepared from the poppy after such importation, (c) fees levied on licenses for the sale of poppy-heads, and (d) fines levied for offences against the Opium Act and Rules.

624. LAW.—The Act which regulates the opium revenue in this Presidency is India Act I of 1878. The provisions of this law are mainly in the direction of making illegal the cultivation, manufacture, possession, transport, import, export, or sale, of opium otherwise than in accordance with rules to be made by the Local Government; and to give the latter the force of law. Conduct contravening the Act or rules with reference to these particulars is punishable with imprisonment of not more than a year, or fine not exceeding Rupees 1,000, or both, non-payment of fine being commutable into imprisonment for not more than six months; and the opium or the poppy-heads concerned in such cases are liable to confiscation, together with the packages, coverings, animals, and conveyances. Officers of the

[1] SKETCH HISTORY OF THE CONNECTION BETWEEN INDIAN-GROWN OPIUM AND THE CHINA MARKET.—It is usually supposed that England first introduced opium into China, which is an error. Early in the sixteenth century the use of the poppy was known to the Chinese, or a century and a half before the English were concerned in its cultivation. It is supposed to have been introduced both into China and into India by Muhomedan traders. The monopoly of opium in Behar was first assumed by the Indian Government in 1778. The exclusive provision of opium on account of the company was then let in farm, first annually, but from the year 1781 in successive contracts for four years. The contractor engaged to deliver a certain quantity of opium at a fixed rate to be paid by the Government. Under this arrangement it was found that the opium deteriorated in quality, and the Government profits in consequence materially decreased. The agency system was therefore resorted to, and from the time the first agent was appointed there was a marked improvement in the trade, which continued steadily to increase. The number of chests of opium in the first year of the agency was 3,733, while in 1838-9 there were 11,629 chests. At this period a change took place in the China trade. Up to that time, though an official prohibition on opium existed in China, the sale of the drug had been tacitly permitted by the authorities; and the trade had gradually grown from a small beginning into an important branch of industry, traders acting as though no prohibition on the article existed. This rapid increase of the opium trade however caused uneasiness on the part of the Chinese Government, and the desire to put it down at once and effectually led to an embargo, 20,000 chests of opium belonging to British traders being suddenly confiscated and destroyed. It was this act of violence that caused the Chinese war, which did not terminate until 1842. The Chinese then paid 21,000,000 dollars towards the expenses of the war, and a further sum of 21,250,000 to the owners of the confiscated chests. The prohibition on opium remained in force after the treaty of 1842, but was finally repealed in the year 1858. The increase in the trade nearly doubled between the years just named; and now that the embargo is taken off, and the importation into China is legalized at a fixed duty the trade yearly increases in value.

Police, Revenue, and Excise departments, above the grade of a peon or constable, have power to enter and seize upon any unauthorized cultivation of the poppy or possession of opium, and are entitled to such rewards as the Magistrate in each case may adjudge. Sums of money due to Government under the Act are recoverable as arrears of land revenue. Arrears due to the farmers from their licensed vendors are also similarly recoverable, provided application is made to that effect to the Collector. The rules of the Madras Government under this Act bear date the 22nd June 1880. Cultivation is not provided for, as there is none in the Presidency. There was some cultivation to a very small extent by hill-men on the Neilgherries, but it has since been prohibited. Manufacture of intoxicating drugs prepared from the poppy is permitted under a license from competent authority. The rules contemplate three classes of agents in the management of the traffic; first the importer or merchant who imports wholesale and sells again to the separate vendor or the farmer who contracts with Government to vend by agency, secondly the farmer just mentioned, and thirdly the licensed vendor either direct under Government or under the farmer. Medical practitioners holding the drug for medical purposes are also recognized. The sale of more than three tolahs of opium, or of more than five seers of poppy-heads, is wholesale. At those amounts and under the sale is retail. The nature of the rules for controlling the different parts of the agency can best be seen from the remarks on the procedure shown below. Opium confiscated under the Opium Act is sent to the Collector's office, or destroyed if unfit for use. Intoxicating drugs confiscated are destroyed. Poppy-heads confiscated are disposed of as the excise officer may direct. A Magistrate convicting an offender under the Opium Act may as above said grant a reward to any person who has contributed to the conviction of the offender. The law in detail is shown under the head of 'Opium' in Vol. II, App. LIV, and the rules having the force of law on the subject are given in the foot-note.[²]

625. CONSTITUTION OF DEPARTMENT.—The opium revenue in this Presidency is administered by Collectors controlled by the Board of Revenue. The Collector has power to appoint his Divisional officers or Treasury Deputies as officers in charge of the opium revenue of their respective ranges. In the Presidency town, the Act is worked by the Town Abkarry Establishment under the supervision of the Deputy Collector of Madras.

626. PROCEDURE.—Merchants intending to import opium or poppy-heads must obtain a license from the Board of Revenue through the Collector of the district into which it is to be imported. The license is granted in duplicate, of which one copy is furnished to the importer and the other sent to the Deputy Opium Agent at Indore. The importer purchases the required opium from the Malwah markets, and each consignment is produced before the Deputy Opium Agent, Indore, or one of his Assistant Agents, who, on the consignments being weighed and examined, issues a passport on payment of a pass duty at Rupees 700 a chest of 140 lb. with a dryage allowance of $\frac{1}{4}$ lb. The agent accounts to Madras for this duty. The consignment is then conveyed by certain routes specified in the Board's license and produced for examination before the Collector or other officer in charge of the excise revenue of the district in which the place of destination is situate. After examination it is passed on to the consignee, who issues the drugs wholesale to the farmers and licensed vendors. A licensed importer may sell by wholesale any quantity of opium or poppy-heads to a farmer, or licensed vendor, and a farmer or licensed vendor may similarly sell any quantity of opium to another farmer or licensed vendor, and to a medical practitioner in quantities that the practitioners are licensed to hold. Retail sale of opium is permitted under a license of the Collector or the farmer, but no such sale should be made at any Collector's office or by licensed importers. A licensed vendor may sell by retail at one time to any person up to three tolahs of either opium or intoxicating drugs or five seers of poppy-heads. The number of shops for each farm should be decided by the Collector, and

[²] OPIUM RULES HAVING THE FORCE OF LAW.—Under Act I of 1878, Sections 5, 6 and 13 (Opium), the following have the force of law:—(1) Sections 5 and 13, Rules—Revenue Notification, Fort St. George Gazette Supplement, dated 22nd June 1880; (2) Revenue Notification, Fort St. George Gazette, dated 13th April 1881; (3) Amendment of Rule 21; (4) Section 6, Duty on each chest of Malwah opium imported into the Madras Presidency; (5) Second-class Magistrates empowered to try cases under Act—Judicial Notification, Fort St. George Gazette, dated 12th October 1880.

sold in auction at the commencement of each year either singly or in groups according to his discretion. Licenses and engagements are interchanged in respect of each of them and hold good for one year. The sale of any quantity of opium or intoxicating drugs exceeding three tolahs or of poppy-heads exceeding five seers is wholesale, and of any less quantity retail sale. Intoxicating drugs may be manufactured from opium under the Collector's license. Any person may have in his possession three tolahs of opium and intoxicating drugs and five seers of poppy-heads, provided they have been purchased from Government, a farmer, or a licensed vendor, or medical practitioner. But no one can hold a greater quantity, unless he is a licensed importer, a farmer, or a licensed vendor, or medical practitioner, or unless specially authorized by the Collector with the Board's sanction, in which case he can hold not more than one seer of opium or intoxicating drugs. Under a license from the Collector a medical practitioner may have for purely medicinal purposes one seer of opium, one seer of intoxicating drugs, and ten seers of poppy-heads. Persons wishing to transport opium from one district to another must first obtain a pass in the prescribed form for each consignment from the officer in charge of the opium revenue of the district from which such opium is to be transported. Each package is stamped in the presence of the officer granting the pass with the official seal. No pass is granted unless the person applying for it produces a written permission for so applying from the officer in charge of the opium revenue of the district to which the opium is consigned. A copy of every transport pass is sent to the last-named excise officer, who examines the consignment on its arrival there, and if satisfied that the packages have not been tampered with, passes it on to the consignee. These rules apply 'mutatis mutandis,' to the consignments passing from one talook to another with the difference that in this case the Tahsildar of the respective localities is the officer granting passes and examining consignments. Exports to Mysore, Travancore, Cochin, Bunganapully, Sundoor, Poodocottah, and the French Settlements must be made under the license of the respective Residents or Political Agents of these places.^[3]

627. STATISTICS.—The current demand on account of the opium revenue during the past three years and nine months of the present administration is given below.^[4] The actual collections during the year 1883-84 under the several heads amounted to Rupees 6,27,673 as shown below.^[5]

[3] SKETCH HISTORY OF OPIUM MANAGEMENT IN THIS PRESIDENCY.—There were no restrictions on the sale of opium prior to 1880. The Opium Act, India No. I of 1878, was brought into force throughout the Presidency on 1st July 1880 and the sales of the opium shops took place in the months of July and August following. During the first two years and nine months the monopoly of the retail vend of opium and intoxicating drugs was sold by auction to the highest bidder at the commencement of each official year, except in the hill tracts of Ganjam, Vizagapatam, and Godavery, on the shop-license system. Under this system the purchasers at auction sales were bound to take out licenses and maintain shops at the localities prescribed, and pay, besides the purchase money for the monopoly privilege, a monthly duty of one rupee for each shop. The monopoly of the retail vend of opium and intoxicating drugs did not then include the privilege of vending poppy-heads for which separate licenses were granted for a period of one year on payment of a fee of Rupees 3 for each shop. The shop-license system was abandoned in April 1883 in favour of a farming system under which the privilege of vending opium, intoxicating drugs, and poppy-heads was sold by talooks. The sale of poppy-heads has very recently been separated from the opium farms, and separate licenses are granted for them on payment of a small fee of 6 annas. In the hill tracts of Ganjam, Vizagapatam, and Godavery the privilege of retail vend has not been sold by auction as in the plains, but licenses have been granted by Collectors at their discretion, the licensees being bound to sell the drug at prices not exceeding a maximum price prescribed. In the Vizagapatam hill tracts Government purchased the opium and supplied retail shop-keepers at certain rates till the beginning of 1884-85. Since 1st April 1884 the supply there has been left to a private contractor. From 1st April 1885 a lump payment determined by tender has been levied for the monopoly privilege of supply.

POST.

628. IMPERIAL POST.—With the exception of occasional references in other Acts, India Act No. XIV of 1866 comprises the whole law relating to the post office.^[1] It is an Act for the internal management of the department, for the regulation of postage charges, and for the punishment of offences against the department. It amended India Act XVII of 1854. The details of the law under subject-heads are shown under the head of 'Post' in Vol. II, App. LIV. Under sections 19, 21, 22, 23 and 63 of the Act, the Governor-General in Council is empowered to fix and alter the rate of postage and to frame rules for the conduct of the post office not inconsistent with the Act, and therein to prescribe the regulations, conditions and restrictions according to which all letters and other articles shall be posted, forwarded, conveyed or delivered, and under section 64 to frame rules for the management of the zemindarry and district dawks. The postal rules having the force of law are given in foot-note.^[2] The various postal circles of India are under the control of the Director-General of the Post Office, an officer under the immediate orders of the Government of India. The Madras postal circle comprehends the Presidency of Madras and the Imperial Post offices and lines established for Political or other State purposes within the territories of the Native States lying within the limits of the Presidency. It also controls a few Imperial offices and lines in the Hyderabad State, namely, those that lie to the south of a line running east and west from Hominadabad. Such offices and lines to the north of this line are controlled by the Central Provinces Postal Circle or by Bombay. All the above States have postal systems of their own, which, though primarily established for administrative purposes, are largely used for private correspondence, and a well-established reciprocity exists between them and the Imperial Post office. The circle is administered by the Postmaster-General of Madras, who serves immediately under the Director-General. The circle is divided into 11 postal divisions generally comprising 2 revenue districts each. The chief postal officer in each division is styled Superintendent of Post Offices. He is assisted by Inspectors of Post Offices, one such officer being appointed for each revenue district. In the Madras postal circle there are at present 942 post offices, i.e., 32 head post offices, 766 sub post offices, and 144 village post offices. Every post office in the Madras Presidency and attached Native States is indicated in

[¹] **SKETCH HISTORY OF IMPERIAL POST.**—On the 24th July 1837 under India Act No. XVII of that year, the Government assumed, by law, the exclusive right of conveying letters by post for hire; but the arrangements were at first very primitive. There was no one controlling head of the department; it was managed by local Postmasters-General who were also the Postmasters of the Presidency towns, while the Collectors of districts had charge of post offices up-country. The dawks consisted of a few main lines of runners connecting the principal towns in the mofussil with the seat of Government, and until 1837 it was a positive privilege to be allowed to send private letters by the Government dawk. Even after that date receipts were granted for every article received for despatch and the addresses of all articles received were entered in lists; these were given to the postmen, who brought back the addressees' signatures upon them. The addresses on all articles passing in transit through post offices were also recorded. Postage was paid in cash and varied according to distance. The English mail was received once a month. In 1854 a uniform rate of letter-postage, irrespective of distance, was introduced, postage stamps were manufactured, and the whole of the post offices of India were placed under the management of a Director-General. In the same year the Postal Act of 1854 was passed repealing the Act of 1837. Its principal features still exist in the present Act XIV of 1866 which repealed it in turn. The year 1854 must therefore be looked back to as the commencement of the present arrangements. The number of post offices in the Madras circle in 1854 was 129; it has risen in 1883-84 to 942, an increase of over 700 per cent. The total number of articles passing through the post office has risen from 5,456,672 in 1854-55 to 31,778,552 in 1882-83. The articles carried by post up to the year 1879 consisted of letters, newspapers, book-packets and parcels. Post cards were introduced in 1879. The system of insurance was introduced in 1878 and that of value-payable articles in 1877. Money orders were introduced in 1880. Postal savings banks were introduced in 1882 and India postal notes in 1883. Telegraph amalgamation with the post office was also commenced at the close of 1883. Telegraphic money-orders were introduced in August 1884.

[²] **POSTAL RULES HAVING THE FORCE OF LAW.**—The principal rules of the Post Office having the force of law are those issued by the Governor-General, bearing date the 31st April 1866, under the heading "Orders and Rules passed by the Governor-General in Council under the provisions of the Post Office Act of 1866."

Volume III of this publication, with some particulars as to each. Mails are carried by railway over 1,815½ miles, by mail carts over 98 miles, by runners 6,377½ miles, by boats 15 miles, and by sea 8,064 miles. At the head-quarters of each revenue district, the post office is termed a disbursing head office. This controls the accounts, salaries, &c., of all the postal officials of the district, and is authorized to deal with all articles of the letter and parcel mails posted for despatch or received for delivery. It is empowered to register articles and also to insure them during transit by post. It can despatch and deliver value-payable articles. It can issue and pay money orders and postal notes and is the chief postal savings bank of the district. With certain exceptions it is also an agency for the sale of stock notes. The officer in charge of a head office is designated Head Postmaster. The sub-office deals with unregistered articles and parcels in the same way as a head office, except that in some cases it does not deliver articles. Sub-offices, with some exceptions, issue and pay money orders, but only certain selected offices are allowed to issue foreign money orders without previous reference to the head office. Sub-offices are generally authorized to sell and pay postal notes and are also sub-savings banks. The officer in charge of the sub-office is designated a Sub-Postmaster. A village post office deals with unregistered and registered articles in the same way as a sub-office, and it can also deliver insured letters, ordinary and insured parcels, and inland money orders. It is authorized to receive ordinary parcels for despatch and applications for inland money orders together with cash from the senders or remitters. A village office may pay money orders sent to it with cash by the account office. It cannot insure articles, or despatch or deliver value-payable articles, or transact savings bank business. The officer in charge of a village office is designated a Village Postmaster. An experiment of employing some village authority, or respectable resident, as Village Postmaster on a trifling remuneration, not exceeding Rupees 5, has been attended with some success. In many cases the men have taken an intelligent interest in the scheme and have succeeded in establishing a post office whose income exceeds considerably its outlay. Village postmen are employed to deliver articles, the addressees of which live beyond the limits of the ordinary postman's beats. They collect articles for despatch and receive articles for registration. They have regular beats to travel, and in most cases by their agency every village of importance is visited at least twice a week, more generally three times a week. At foot [²] is a comparative statement showing the advance of the department, as far as this circle is concerned, during the last thirty years. The Postal Guide, Postal Abstract, and Mail Calendar are books containing information on postal matters and can be purchased at all post offices for a trifling cost.

629. DISTRICT POST.—Under India Act XIV of 1866, section 64, the Governor-General in Council is empowered to frame rules, from time to time, for regulating the district dawks, and in exercise of that power sections 25, 27, 35, 42, 43, 44, 45, 47, 48, 49, 50, and 51 of the Act just named have been made applicable to the district post in this Presidency. All the receipts from postage stamps are credited to Imperial, and even cash payments incidental to unpaid or insufficiently paid letters sent by district post are collected by the Imperial Department, so that in fact all the receipts of the district post are credited to Imperial revenue, while all the charges remain a burden on Provincial funds. In former years a grant was made to Provincial revenues to cover the cost of the district post, but in 1882-83, under the decentralization scheme, this grant was included in the lump sum given as contribution to Provincial funds. In the estimate of charges for 1884-85, the cost of the district post is given as Rupees 1,13,500. The district post as now

arranged [4] furnishes inter-communication between those parts of the country which are removed from the general post lines. The talook stations are the first connected, and between these the delivery is carried out by the ordinary staff of village postmen. The delivery into outlying villages is carried out by a system called the rural delivery. The rural delivery establishment consists of a staff of itinerating postmen, whose beats are so arranged that they shall visit the principal villages in the talook once, twice, and thrice a week, or daily according to the importance of the village, its accessibility, and the funds that are available; and of village letter-boxes or places of call for the postmen. These boxes are in charge of, and managed by, respectable inhabitants or officials, such as village moonsifs or curmums of the village, who in some cases give their services gratuitously, and in other cases are paid a small stipend of Rupees 2 a month. If the receipts on any line exceed the charges, the Postmaster-General takes over the establishment to Imperial, and Collectors, with the sanction of the Board of Revenue, can appropriate in extending the district post to remoter tracts the funds thus set free. This system has gone on until there is now left to the district post little but rural delivery in the poorer portions of the districts. The district post establishments [5] are all under the control of the Imperial Postal Department for the sake of uniformity and discipline. The only difference between the Imperial post and District post is that the former is a charge on Imperial revenues and restricts its operations to remunerative lines and localities. If the district post were amalgamated with the Imperial Postal Budget, postal facilities would doubtless be withdrawn from several localities to which they have been extended by Collectors. During the year 1883-84 rural delivery was in operation, with more or less of financial success, in 135 talooks of 20 districts, and in 28 talooks solvency had been

[4] SKETCH HISTORY OF MADRAS DISTRICT POST.—The district post existed in this Presidency for the transmission of official correspondence between Collectors and Magistrates and their subordinates, then no connection with the ordinary Postal Department, and the dawks were carried by the persons belonging to the Revenue establishment as they could be spared from other duty. There were separate charges appeared in the accounts. In 1846 the district post was by order of Government opened to public on payment of postage in cash. The agency continued the same, and the district postage, regulated on different principle from the post rates of the ordinary Postal Department, furnished a fund credited to the district in which it was raised. A letter passed on from the regular post to the district post for delivery at an outlying village where there was no regular post office, was charged district rate in addition to the regular postage, and vice versa. There was no inter-communication between the two posts. It was not at this time contemplated that the district dawks should be a source of profit to the State; consequently it was understood that the Collector of each district was authorized to expend on the improvement of the district postal system any revenue which it produced. The receipts grew very rapidly, and in 1848-49 amounted to Rupees 21,734. In 1854 postage stamps were introduced in lieu of cash payments in the regular Postal Department, and simultaneously it was arranged that as regards matters of payment, as far as the public was concerned, there should be no distinction between this post and the district post: the two forming one system for the public convenience. From this date the district post may be said to have been converted into a feeder of the Imperial post.

established and Imperial amalgamation had taken place. The net results of the system, so far as it has gone, goes to show that in the richer districts, such as Tanjore, Godavery, Kistna, Malabar, Tinnevely, and South Arcot, the rural delivery is appreciated by the people; but that it will take some time before it is largely used in the poorer districts. It is noteworthy that where missions have established rural education, this post receives a great stimulus. Fluctuations in receipts are occasioned by a variety of causes; being for instance at a maximum in the early months of the year, when marriages are being celebrated, and at a minimum in the rains when people are engaged in agricultural pursuits.

630. OFFICIAL POSTAGE.—The rules relating to inland and foreign official postage will be found in Vol. II, App. LXXXVIII.

TELEGRAPH.

631. DESCRIPTION.—The Telegraph Department is directly under the Imperial Government, and there is no local control. The Madras Presidency embraces three complete telegraph divisions called the Madras, Bellary and Malabar Coast, and part of a fourth called the Ganjam division. In 1884 the extent of lines in the Presidency was as at foot.[¹] Not included in this statement are the following lines, which are the exclusive property of the Madras Government: line from the Observatory to the Time Gun; line from the Observatory to the Marine office; line at the Powder Proof Range. A map showing the telegraph lines and stations is excluded here by necessities of publication, but will be found in the collection of maps given with Vol. III. Telegraph offices may be divided into three classes: departmental offices; licensed offices equipped and maintained by the department but worked by State Railways or Canals; and licensed offices equipped, maintained and worked by Guaranteed Railways. On the 31st March 1883 the number of telegraph offices open in the Presidency was as under.[²] There is also a telephone system in Madras consisting of 6 miles of line, 30 miles of wire and 10 offices, the property of the department, rented to the Madras Government. The telegraphic requirements of Madras itself are met by a central office in Black Town and 9 district offices located in Fort St. George, Mount Road, Vepery, Triplicane, St. Thomas' Mount, St. Thomé, Sydapett, Chetput, and Adyar. The cable of the

Eastern Extension China and Australia Telegraph Company is laid between Madras and Penang, and the greater number of the messages from Europe to the far East pass across India via Bombay and Madras. A first-class office is kept up at Paumben in the island of Rameswaram attached to Madura district to regulate the traffic between Ceylon and the western and eastern lines in India. Two short cables are laid across the Paumben Channel connecting the island of Rameswaram with the Indian mainland, and another cable 33 miles in length is laid from the island of Rameswaram to Tallamanaar on the island of Manaar attached to Ceylon. Ootacamund, the seat of Government during the hot season, is connected telegraphically with the rest of India by three routes. One wire connects it with Mysore, another with Calicut and the West Coast, and a third with the Madras Railway system at Mettapolliem. All three lines run through heavy jungle at the foot of the hills and are liable to interruption from falling trees and wild elephants. At Bezwada, where the telegraph line crosses the Kistna river, there is a single span which is probably the longest in the world, the distance from post to post being 1,800 yards, or rather over one mile. This span is made possible by the high banks on either side of the river. The Telegraph Act in India Act I of 1876. The law in detail is shown under the head of 'Electric Telegraph' in Vol. II, App. LIV, and the rules with force of law below.^[2] The next table below^[3] gives the number of miles of lines, the total receipts, and the working expenditure of the Government telegraphs throughout India, in each of the ten fiscal years from 1873 to 1882. Previous to 1881 the Ceylon telegraphs are included in the statistics.

[²] TELEGRAPHIC RULES HAVING THE FORCE OF LAW:—Under section 7 of India Act I of 1876, the Revised Tariff on Inland Messages, published in the Fort St. George Gazette, of 31st December 1881, has the force of law.

CHAPTER V.

FINANCE.

FUNDS AND SERVICES.

(a) *Preliminary.*

632. INTRODUCTION.—The revenue and expenditure of the Presidency may be regarded under five heads, the classification being mainly according to the nature of the control exercised; that is to say according as the funds are administered exclusively by the Government of India, by a mixed control of the Government of India and the Local Government, exclusively by the Local Government, for special or local objects, or under such circumstances that they are excluded from the accounts of the empire. This gives the heads Imperial, Imperial and Provincial combined, Provincial, Local, and Excluded. Imperial and Provincial revenues are derived from the same sources, and are available by law for the general purposes of the empire as a whole; the term Provincial however has been since 1871 applied to that portion of the Imperial revenue, which as a matter of contract between the Imperial and Provincial Governments is allotted for the Provincial administration. Since 1881 again [¹ to 4] the Imperial and Local Governments have had a combined

[¹] SKETCH HISTORY OF THE FINANCIAL DECENTRALIZATION SCHEMES.—*First decentralization scheme.*—The Provincial head of account was opened in the year 1871 as a result of the first decentralization scheme. The main object of this scheme formed at a time of some financial pressure was to definitely limit the demands of Provincial Governments on the Imperial Exchequer on those important branches of civil expenditure, where from the progressive spirit of the age the demands for increased outlay had most arisen and would most arise, and in which from the very nature of the case, the supreme central authority was least able to check the requirements of the local authorities. It was moreover confidently anticipated that the increased financial control afforded to the Local Governments over the transferred heads would give them an additional interest in the study and the enforcement of economy in expenditure and would conduce to administrative as well as financial improvement. A fixed allotment was assigned to the Provincial Governments for expenditure on Jails, Registration, Police, Education, Medical Services, excepting Medical Establishments, Printing, Roads and Miscellaneous Public Improvements, and Civil Buildings, the total receipts from these services being also made Provincial. The Local Government subject to certain general rules were authorized to regulate at their discretion all the expenditure on the transferred services. If the existing income, that is to say the Imperial allotment-plus departmental receipts, exceeded the requirements of any particular service, the excess was at the disposal of the Local Government for expenditure in other directions. If it did not suffice, the Local Governments were debarred from applying for fresh grants to the Government of India, and were required to raise what was needed by local taxation, or else to cut down expenditure to such an extent as to make an equilibrium between their receipts and expenditure. (2) *Second decentralization scheme.*—A revised decentralization scheme involving large changes in the scheme of 1871 was introduced in the beginning of 1882-83 and is now in force. The principle of this revised scheme is that instead of Local Governments receiving a fixed sum of money to make good any excess of provincialised expenditure over provincialised receipts, a certain proportion of the Imperial revenue of each province should be devoted to this object. Certain heads as few in number as possible are wholly, or with minute local exceptions only, reserved as Imperial; others are divided in proportions for the most part equal between Imperial and Provincial; the rest are wholly, or with minute local exceptions only, made Provincial. The balance of transfers being against the Local Government is rectified for each province by a fixed percentage on its Land revenue (otherwise reserved as Imperial); except in Burmah, where the percentage is extended to the Imperial rice export duty and salt revenue also. The advantage of this system over that of the former Provincial scheme is that the Provincial Governments are given a direct interest not only in the provincialised revenue but also in the most important item of Imperial revenue raised within their own province. A further important change introduced by the new decentralization scheme was the modification of the power previously reserved to the Supreme Government of withdrawing such portion of the local resources as they saw fit in the event of any fiscal misfortune, such as heavy loss in the opium revenue or national disaster, such as war or famine. The resolution showed that on two occasions within a decade this power had been acted on, once on the occasion of the great famine, and again on the occurrence of the Afghan war; and while it was admitted that the circumstances of the time were peculiar, and that the strain on the finance was undoubtedly severe, it clearly pointed out that the sudden suspension of improvements in progress, the starvation of public works, and the discouragement of care and economy by requiring a surrender of their results, could not be otherwise than prejudicial. The Government of India declared therefore on the one hand that the Local Governments must look for no special aid from the Imperial Government except in the case of severe famine (and then only within certain specified limits), and on the other that the Imperial Government would make no demand on them except in the case of disaster so abnormal as to exhaust the Imperial reserves and resources and to necessitate a suspension of the entire machinery of public improvement throughout the empire. The limit to which Provincial financial responsibility was to be enforced in the event of famine was stated as follows. The current Provincial income during the period of distress was to be entirely

interest in so many of the funds and services, that the want is felt of a new term to indicate the group. By Local revenues are meant revenues derived from special sources, and devoted to special objects and not to the general purposes of the administration, whether Imperial or Provincial; the chief examples in the Presidency of this class of revenue being the funds raised under the Local Funds Act, Madras No. V of 1884, which are devoted by law to the construction and maintenance of roads and communications, the diffusion of education, the construction, repair and

exhausted, every avoidable expense in every department being retrenched, and the public works grants being applied to famine works to the utmost limit possible. The accumulated savings of past years in excess of the ordinary working balance were to be drawn upon to two-thirds only of their total amount. Thirdly the margin of provincialised income over expenditure in normal years, i.e., the Provincial Governments' profit on the contract available for public improvements, was declared to be liable to whatever extent might be necessary in addition to the ordinary public works grant for the completion of works begun as relief works under the pressure of famine. In cases where no such need for completion remained after a famine, this third resource was to be chargeable up to one-fourth, at most, for payment of interest of Imperial loans (if any) which might have been raised to meet the excess cost of the famine in the province. (3) *Its effects*.—The effect of the scheme was to provincialise about three-fifths of the revenues and about one-fourth of the expenditure of British India, that is to say, the Provincial Governments were to have to a greater or less extent according to the circumstances of each head, an interest in, and responsibility for, their administration, the Government of India declaring their policy to be "that it was expedient that a Local Government should possess a substantial independent interest in the improvements of the revenues which it collects and the restriction of the expenditure which it incurs." (4) *Its conditions*.—The mode in which the revenues and charges were apportioned between the Imperial and Provincial Governments is shown in the tabular statement given in Vol. II, App. LXXXIII. The conditions of working are detailed in the next note. It is to be understood that this scheme refers, generally, only to items recorded in the accounts of the several provinces, whether Civil or Public Works, and does not refer to items recorded in the accounts of the Central Government only such for example as the Mint, Imperial Post Office and Telegraph Revenues, the Revenues of Ajmeer and Coorg, the Guaranteed Railways, or the East Indian Frontier, Rajpootana or Central India State Railways. (5) *Statistics for Madras*.—The sum assigned to this Presidency in 1871 for the maintenance of the transferred departments and services and to enable the Government to meet its share of the proportion of the Public Works Establishment employed on the two classes of Public Works thenceforward to be treated as Provincial, as also to purchase tools and plant in 1871-72, was Rupees 73,91,880; and the departmental receipts were estimated to produce a further sum of Rupees 8,18,100; making a total Provincial revenue of Rupees 82,12,980. The total expenditure on the same service in the previous year had amounted to Rupees 87,67,260, but as measure of relief to the Imperial Exchequer it was found necessary to make some reduction in the expenditure of the services, and the reduction from Madras amounted to a sum of Rupees 5,51,280. Additions to the Provincial Fund were subsequently made by the Government of India for various minor services, the financial control over which was transferred from time to time to the Local Government; and the Provincial revenues in 1881-82, the last year during which the first decentralization scheme was in force, amounted to Rupees 1,08,68,430, including a sum of Rupees 4,00,000 which was a refund by the Government of India of the amount contributed by Provincial revenues in 1879-80 and 1880-81 towards the cost of the Afghan war. Excluding this special sum the Provincial revenues in 1881-82 amounted to Rupees 1,04,68,430, while the charges wholly Provincial amounted to Rupees 1,02,31,520, showing a surplus for the year of Rupees 2,36,910. Adding to this the net surpluses of previous years amounting to Rupees 3,46,510, and also the sum of Rupees 4,00,000 above referred to, and a further sum of Rupees 1,20,190 temporarily advanced to a special fund to obviate a deficit, the closing balance at the credit of Provincial revenues at the close of 1881-82 amounted to Rupees 11,03,610. In the third foot-note a running account of Provincial services is given from 1871-72 to the end of 1881-82. The fourth foot-note compares the Provincial receipts and charges of 1882-83, the first year of the new decentralization scheme, with those of 1881-82, the last year under the old scheme. The effect of the new scheme, it will be seen, was to place under Provincial control an expenditure of upwards of 222 lakhs as compared with a Provincial expenditure of less than half that amount under the old scheme.

(2) *CONDITIONS FOR THE ADMINISTRATION OF PROVINCIAL RECEIPTS AND SERVICES UNDER THE PRESENT DECENTRALIZATION SCHEME*.—(1) Without the previous sanction of the Government of India—*"a"* No additional taxation may be imposed, and no change made in any existing system of revenue management. *"b"* No new general service or duty may be undertaken: whenever a Local Government proposes to undertake any such new service or duty, it must satisfy the Government of India that it can provide the funds for it, temporarily, if the service or duty is temporary, and permanently, if it is permanent. *"c"* No appointment may be created with a pay of more than Rupees 250 a month and no addition may be made to the pay and allowances of any officer if they exceed, or would, after the addition, exceed Rupees 250 a month. *"d"* No appointment of which the pay and allowances are more than Rupees 250 a month may be abolished; and the pay and allowances of no such appointment may be reduced. *"e"* No class of grade of officers may be created or abolished; and the pay of no class or grade of officers may be raised or reduced. *"f"* The rates of discount upon the retail of stamps and Court-fee labels, and the local duty on spirit and drugs, must not be altered: the Governor-General in Council reserves the right of forbidding any such alterations as are likely to injure the revenues of neighbouring provinces or prove otherwise inconvenient. *"g"* No addition may be made to the pay or allowances of any officers, that may lead to increase in the emoluments of any public servants doing duty in the provinces, whose pay and allowances are not charged under one of the transferred heads of services. The Government of India reserves the right to forbid alterations in rates of pay or allowances, which, in its opinion, would produce inconvenience in other provinces. *"h"* No money may be removed from the public treasury for investment, or deposit elsewhere: the Government of India, which is responsible for the provision of ways and means for the public service in all departments must always retain as at present, in its own hands, absolute and unconditional control over all money in the public treasury: a Local Government may not withdraw such money except for expenditure upon the public service. *"i"* No alteration must be made in the form or procedure of the public accounts. *"j"* No services previously rendered to other departments at the charge of the departments made over to the control of the Local Governments may be diminished, and no services previously rendered to those departments at the charge of other departments may be increased. *"k"* No line of through communication may be abandoned, or allowed to fall out of repair. (2) Returns are to be made quarterly, through the several Administrative Departments of the Government of India, to the Financial Department, showing every change made in the pay of any officer, every new office created, and every existing office abolished; also any unusual or extraordinary charge incurred, and any expenditure discontinued. (3) All Standing Orders and Rules of the Supreme Government are to be observed, including, in particular, the rules in the Codes of the Financial and Public Works Departments, Travelling Allowance Rules and the Rules and Circular Orders of the Comptroller-General. (4) Returns, accounts, and estimates are to be submitted to the Supreme Government in such forms, and at such times, as may be prescribed. (5) The Local Governments must keep the Governor-General in Council, in the several departments, fully informed of their executive and financial proceedings; the Governor-General in Council will not relinquish his general powers of supervision and control in any department: but His Excellency in Council will, as far as possible, avoid interference with the details of the administration of the transferred revenues and services, and any embarrassment of the provincial finances. (6) A Local Government must accept, without remonstrance, any charge which would, under the system in force before 1871-72, have been recorded, under any of the transferred Heads of Account, in the accounts of its Presidency or Province; and must not raise objections on such grounds as that the charge has originated outside the Presidency or Province, or that the Presidency or Province is not interested in it, or the like: if any doubt

working of hospitals, dispensaries, lunatic asylums, choultries, markets, tanks, and wells, and to other local purposes in the districts where the funds are raised; the Village Service Cess devoted to the payment of the village revenue and police establishments in the localities where it is raised; and the Canal and Ferry Fund devoted to the maintenance of the canals and ferries on which the tax is raised. The Excluded Funds comprise among others; Municipal, Cantonments, Port, Educational, Dispensary, Hospital, and Trust or Endowment Funds

arises at any time, whether any charge should or should not be entered under any particular head in the accounts of any Presidency or Province, such doubt must be solved by one test only, viz., "How would it have been entered if it had occurred before 1871-72, when the powers and responsibilities of Local Governments were first enlarged?" Thus, for example, the pay or leave allowances of an officer belonging to another administration on duty or on leave in the North-Western Provinces, and drawn there, must be charged in the accounts of the North-Western Provinces: the Governor-General in Council did not intend, by the measure of 1870, and does not now intend, to introduce, or authorise, any change of practice in such matters or any inter-provincial, inter-presidential or inter-departmental adjustments, not theretofore allowed: in regard to all such transactions, the arrangements made with the Local Governments were calculated upon the basis of the system which existed before the year 1871-72. (7) The grant made to a Local Government for all the services entrusted to its administration is a consolidated grant: no claim will lie against the Imperial Treasury on the ground that the cost of any service exceeds the amount at which it was estimated in the calculation of the consolidated grant. (8) In the management of its finances, a Local Government must never absolutely exhaust its balance in the Imperial Treasury: the Government of India will not accept any estimates, or allow any transactions, by a Local Government, which involve the expenditure of more money than is at its credit in the Imperial treasury: it is the duty of every Accountant-General to take care that this condition is never infringed, and promptly to report to the Governor-General in Council any transgression of it which is not, upon his representation, immediately rectified by the Local Government addressed. (9) A Local Government may not lend money from the balance at its credit in the Imperial treasury: the Government of India will always pay every attention to any recommendation for the loan of public money in excess of the powers which are entrusted to a Local Government by law or rule; but all loans alike must be from the Imperial balances; such operations must not be mixed up with the arrangements between the Imperial and the Local Government for the collection and appropriation of the public revenues or the administration of the public services. (10) It is a general condition precedent to the delegation of all authority to disburse public money that it shall be bona fide for a public object; nothing must be carried out by means of the public funds for the advantage of any individual or body of private persons, unless, in accordance with some declared or established rule or principle, recognised by the Government of India: it is the duty of every Audit officer, at all times, to challenge any infringement of this principle; and every Local Government must submit, for the orders of the Government of India, any representation made to it by any Audit officer in accordance with this rule which it does not promptly accept. (11) On or before the 31st January of each year, each Local Government must forward to the Government of India in the Financial and Public Works Departments and publish in the Local Government Gazette, in detail of major heads, with such explanations as may be necessary for the due understanding of its financial administration—"a" An account showing the balance of the Local Government in the Imperial treasury at the beginning of the last complete financial year; the revenues appropriated during that year to provincial uses and the supplementary assignment from the Imperial treasury; the expenditure under provincial responsibility during that year; the balance of the Local Government in the Imperial treasury at the end of that year. "b" Revised estimates in the same detail for the current financial year. "c" Estimates in the same detail for the coming financial year. (12) The Governor-General in Council reserves power to modify, add to, or repeal these rules and conditions at any time.

generally. It will be observed that whereas the funds levied in the rural districts under Madras Act V of 1884 are incorporated in the accounts, the Municipal Funds levied in towns are excluded. The distinction is from many points of view arbitrary. There are however certain technical grounds for a distinction.

Thus Local Funds under the Act of 1884 are for the most part collected by the ordinary Government agency of the country, and by means of an entry in the usual revenue puttah; while in the case of funds raised under the Municipalities Act, the town councillors are left to collect their own resources. Moreover generally speaking the interference of Government is less frequently and less directly exercised in the case of Municipal Funds than in the case of funds under the Local Funds Act. The reason for excluding from the public accounts sent to the Government of India the funds last named, viz., Port, Educational Building, Endowment, and Cantonment Funds, is similar; the funds that is to say are regarded as specific trusts. The order of treating these subjects in the Administration Reports is partly what has just been described. The section shown there on "Gross Income and Expenditure" explains the figures of gross receipts and expenditure, and compares them with those of the previous year. Information is afforded as to the surplus of the receipts of the Presidency over its local requirements, and as to the mode in which this surplus is remitted to other Presidencies. Mention is made of the arrangements for supply of different kinds of money to the different treasuries, and their sufficiency or otherwise is noted. Important changes in account-keeping are mentioned. The next section combines for convenience the Civil Funds and Services under the first four of the heads above-mentioned. It gives to begin with a general statement, which includes incidence of taxation; and then proceeds to particular statements of the heads Land Revenue, Abkarry, Customs, Salt, and Stamps, these being the heads of principal general interest. The other sections are Imperial, Public Works, Postal, Telegraph, and Military; Provincial services treated apart; Local Funds treated apart; and Excluded Funds. It may be observed that the Government do not attempt to show a literal agreement between the audited figures put out by them in the Finance section of their Administration Report and the unaudited figures incidentally mentioned in reporting on the administration of other departments. It will be understood also that the finance chapter deals only with the financial bearings of each subject from the point of view of the Government Financial Department, leaving the administrative bearings of the same subjects to be elsewhere treated.

633. METHOD OF FINANCIAL ADMINISTRATION.—The funds above-classified are controlled generally by the Local Government, and administered in detail by heads of departments or by the Board of Revenue under the supervision of Government. The Board of Revenue administer in detail the Land Revenue, Forest, Excise, Customs, Salt, Stamps, District Post, District Presses, and many of the so-called Special Funds; while Jails, Registration, Police, Education, Medical, and Marine Services, with a few of the Special Funds, are administered in detail by the respective heads of those departments. In the case of Military and Public Works the arrangements are somewhat special. For Postal and Telegraph there is no local control. In keeping its accounts the Local Government is assisted by Imperial officers, who, though subordinate to the Government of India, are required to conform to all requisitions of the Local Government which may not be opposed to the specific orders of the Government of India. The principal of these officers is the Accountant-General, who, besides his duties connected with accounts and audit, has the duty also of advising the Local Government on all matters of finance. The Accountant-General acts as general paymaster to the Local Government. He is also appointed Commissioner of Paper Currency.

634. BUDGETS.—At a sufficient time before the commencement of each official year heads of departments place before the Local Government an estimate of the probable income and expenditure of their departments under all heads for that year. The material thus sent in is grouped by the Local Government under some of the sub-section heads mentioned in the classification given above, or some of their sub-divisions, and budgets are prepared for those heads. The Imperial Services budget goes to the Government of India for final manipulation and inclusion in the general budget for the empire. The details of the others are not revised by the Government of India, and the Local Government is therefore competent to dispose of them finally, merely reporting results to the Government of India. But though the budgets stand thus theoretically on a different footing, they all go practically to the Government of India in one combined Provincial and Imperial

budget. For budget purposes the funds classed above as Local are called Incorporated Funds, which means funds incorporated with the Provincial budget.

635. The mode of dealing with the budgets may be seen by noting the particular case of the Provincial Services budget, where the orders of the Local Government are practically final. In this case District Collectors or other local officers supply the head of the department with approximate estimates of their receipts and expenditure for the ensuing official year. This is done about September in the current year. The subordinate estimates usually contain figures in three columns side by side, showing the actuals of the previous year; the estimate already sanctioned for the current year; and the proposed estimate for the ensuing year. The actuals in the first column are often not the audited figures as finally given by the auditing officer, but for budget purposes this cause of inaccuracy is unimportant. In some cases a "regular estimate" for the current year, consisting of the ascertained actuals of so many months of the current year, added to a newly prepared estimate for the remaining months, is added as a fourth column. The subordinate estimates prepared in this way are revised by the head of the department, in communication, if necessary, with the local officer, and are worked up into a complete budget estimate for that department, and forwarded to the Local Government with remarks and explanations. This is done usually by December in the current year. The Local Government then revises and passes on the estimates to the Accountant-General who brings together the departmental budgets into a single Provincial budget for the Presidency, which is forwarded in a combined form to the Government of India for their information. As soon as the state of the Provincial balances is ascertained, and in some unimportant cases even before that is done, the Local Government send back the departmental budgets separately to the heads of departments with final orders upon them. In some cases the budget is sanctioned as submitted; in other cases the amounts are altered to suit the exigencies of other departments, or for reasons peculiar to that particular budget. The heads of departments in turn transmit the budgets thus received, or portions of them, to the local officers concerned.

636. A sanctioned Provincial departmental budget indicates to the head of the department and to the auditing officer the limits of expenditure for the year to which it relates. The budget is comprised of various entries, according to the subjects concerned and the sub-divisions or officers composing the department; each appropriation entry is complete in itself, and cannot, under ordinary circumstances, be exceeded. On the other hand, under certain conditions any expenditure may be incurred during the year up to the amount of that entry. The main conditions are: that the expenditure shall be of a nature, such as under an ordinary construction can fairly be brought under that head of entry, and in cases where such a restriction is necessary, shall be distributed over the year in a reasonable way suitable to the circumstances; to decide as to both of which is left to the discretion of the spending and auditing officers; again that no more than certain fixed amounts shall be spent without special sanction on any one item, whatever the condition of the funds under the appropriation entry, and that in some cases no expenditure at all shall take place on certain things, for instance new establishments, without special sanction, both of which checks are provided for by standing orders of the Local Government. In all these matters the head of the department controls the subordinate officer, and the Local Government controls the head of the department. New establishments cannot be sanctioned by any authority lower than the Local Government, and general rates of pay and allowances can be altered only on the authority of the Government of India. The transfer of funds from the appropriation entry of one local officer to that of another, or from one "minor head" to another of the same officer's appropriation, can usually be effected by the head of the department, but never by any local officer. Similarly, the transfer of funds from one department to another, or from one "major head" to another of Provincial Services, can be carried out by the Local Government, but not by any head of department. If an officer finds that the funds under any one of his "minor heads" are exhausted, or are insufficient for his purposes, he applies to the head of the department, who will either provide money from such reserve as he may have at his disposal under the budget-head of "reserve," or will obtain

funds from "savings" in one or other of the methods just mentioned. In effecting transfers from "savings," the head of the department ascertains the state of the funds in other branches of his department or under other budget entries of the same branch, either by communication with the local officer himself, or by application to the accounting officer, whose books will give the necessary information. If these measures do not suffice, application must be made by the head of the department to the Government, who will then, if it thinks fit, assign funds from its own reserve.

637. FINANCIAL POWERS OF EXECUTIVE DEPARTMENTS.—The financial powers of the Board of Revenue are in many respects larger than those of any other executive department; their mention here will illustrate some of the remarks given above. The officers controlled by the Board are Collectors, the Director of Revenue Settlement and Agriculture, the Commissioner of Salt and Abkarry Revenue. The Conservators of Forests and the Superintendent of Stamps; Collectors administering nearly all the subjects mentioned above as belonging to the Board. Items on which these subordinate officers can incur no expenditure without previous sanction, whatever the state of funds under the corresponding appropriation entry, are original Public Works costing more than Rupees 1,000 or repairs costing more than Rupees 2,000 in the Land Revenue and Customs Departments; the Salt and Abkarry Commissioner has the power of sanctioning estimates for both original works and repairs up to a limit of Rupees 2,000; law charges in civil suits; refunds of unauthorized collections other than law fines after two years have elapsed; office furniture costing between Rupees 50 and 100 each; binding books; press materials; office rent; and various other less important items. The Board have to go to the Government for sanction in the following cases: Salt, Land Revenue or Customs works costing more than Rupees 5,000; purchase of periodicals and books costing Rupee one and more; with various other items. No mention is here made of such conditions as are common to all departments; for instance, the prohibition of entertaining new establishments without Government sanction.

638. DISBURSEMENTS.—Government money is lodged at the Presidency town with the Bank of Madras, and at Berhampore, Cocanada, Goontoor, Negapatam, Tuticorin, Calicut, Cochin, Mangalore, Ootacamund, and Bellary with its agents, under Presidency Banks Act XI of 1876. There is also a reserve treasury attached to the Currency office at Madras into which all funds in excess of what are required for immediate disbursements are placed until their removal to Calcutta or other provinces. At all other places Government money is left in treasuries under charge of Collectors of districts. There are 24 district treasuries, including those managed by the branches of the Bank of Madras, besides 333 talook and subordinate treasuries; the former are usually under the immediate charge of Treasury Deputy Collectors and the latter under the immediate charge of Tahsildars. The funds due from taxation and other receipts are paid into the various treasuries, and it is the duty of the Accountant-General to arrange by remittances of cash and other measures that the funds are duly distributed over the country in accordance with public requirements. Remittances from other Presidencies to this Presidency are very rare. The Accountant-General provides funds for all departments. If a local officer has authority to spend money and wishes to do so, he draws the sum from the nearest treasury or bank keeping Government funds. The rules for disbursement vary in different departments. Generally, however, it may be said that an officer wishing to draw cash tenders a bill or claim, and if the charge is unusual quotes the authority; if the claim is an authorized one the Treasury officer pays the money and takes a receipt from the payee, or if the business of the treasury be managed by one of the banks orders it for payment at the bank. At head-quarters the Collector delegates all his powers in connection with the treasury to the Treasury Deputy Collector; the subordinate Treasury officers at the talooks can ordinarily make payments only on the authority of the Collector or Treasury Deputy Collector. In connection with lodgment of Government funds with treasuries and banks, it should be mentioned that local officers are authorized to withdraw and retain a certain small portion of the funds under a system of permanent advances for conducting current expenditure under certain of their budget heads. The transactions of all talook and subordinate treasuries are reported

monthly to Collectors, by whom they are incorporated in the district account and forwarded monthly to the Accountant-General.

639. TREASURY CASH ARRANGEMENTS.—The bulk of the money in the District Treasury is in a chest under the double locks and keys of the Treasury Deputy Collector and the Cashkeeper, only a sufficient sum which should never exceed Rupees 5,000 or the day's expenditure being placed in charge of the Cashkeeper for current expenditure. As regards the amount of money to be left with the Cashkeeper the rule is that it should not be larger than is necessary for the convenient transaction of the Government business, or larger than the security given by him; and when the balance with the Cashkeeper in the evening of any day exceeds 5,000 rupees, the excess is usually transferred to the double lock store. The officer in charge is personally present when cash or stamps are taken out of, or put into, the receptacles under double lock and key. The treasury is examined monthly by the Collector, or one of his Covenanted Assistants, and a report is made to the Accountant-General as to whether the amount in it is correct. The examination is made by a Deputy Collector, other than the Deputy Collector in charge of the treasury, if it is impossible for any of the Covenanted officers to conduct the examination. Every evening the Deputy Collector in charge of the treasury signs the cash-book. He also examines the balance in the expense chest with the Cashkeeper, roughly every evening and in full detail at least once a week. The periodical detailed examination of the money in the expense chest by the Deputy Collector is always reported to the Collector. The Cashkeeper retains in his sole charge stamps to the value of Rupees 1,000 or a week's supply only. District treasuries are inspected twice a year by Collectors themselves, whose reports to the Accountant-General are communicated with his remarks to the Comptroller-General and the Board of Revenue. The Talook treasury is under the joint lock and key of the Tahsildar and Talook Sheristadar, both the keys being in the sole charge of the latter when the former is absent from head-quarters. The Talook Sheristadar examines every evening the balance in the treasury, and signs the chitta with a certificate that the balance has been found to be correct. The chitta is countersigned by the Tahsildar when he is present at head-quarters. Shroffs or subordinate Cashkeepers are never placed in charge of the keys of the treasury, either in the district or the talook. They are only held responsible for bad coin and over-payments during the day. The Tahsildar examines the balance in the chest not less than twice a month, and every time he leaves and arrives at head-quarters; and reports having done so to the Collector of the district. Talook treasuries are examined by the Collector or one of his assistants not less than once a year and a report is made to the Board of Revenue.

640. ACCOUNT AND AUDIT.—The accounts kept by treasuries and forwarded to the Accountant-General are chiefly records of receipts and disbursements, entered in prescribed forms of a more detailed nature than the budget forms. The principal return is the monthly Treasury Account. The Presidency books of the Civil Department are kept by the Accountant-General, those of the Military Department by the Controller of Military Accounts, those of the Public Works Department by the Examiner of Public Works Accounts, and those of the Postal and Telegraph Departments by the Compilers of those accounts. The accounting officers here mentioned, other than the Accountant-General, are furnished by the Accountant-General with monthly accounts of their respective departments, as appearing in the treasury accounts in different parts of the country. Such departmental accounts are treated as remittances in the Accountant-General's books. The accounts of the local Accountant-General are rendered finally to the Comptroller-General, by whom they are incorporated in the Imperial books of the Government of India. Military transactions are accounted for to the Accountant-General, Military Department, Calcutta, and by him to the Comptroller-General. Similarly for Public Works which go into the Imperial books through the Accountant-General, Public Works Department, Calcutta, and for Postal and Telegraph transactions which are adjusted through the departmental accounts branch of the Comptroller-General. Provincial and Local Public Works form part of the report of the Examiner, Public Works Accounts, but their amount is reported also to the local Accountant-General for final adjustment. The local accounting officers perform the duties of audit as well. At

the Presidency town itself disbursements of the Civil Department, except those of the nature of advances, are made after audit by an officer of the Account Department and on his orders. Elsewhere they are made in anticipation of the audit of the Account Department.

641. STATISTICS.—The table at foot [°] shows the gross income and expenditure of the past year and each of the previous years from 1875-76. The next table shows the gross receipts and payments of the Presidency during eight decades of the present century.[°] The total payments to Government in the Presidency, exclusive of tributes from native states, per head of population, compare with those in

the other parts of India as shown hereunder [7] taking the latest available figures. The figures given in Vol. II, App. LVI, for some of the principal countries in the world for a recent date are given in illustration of those shown above; but comparison must be made with caution, as the term revenue is used in varying senses in the financial statistics of different countries. The receipts have been converted into Indian currency at the supposed rate of two shillings the rupee. The next table at foot [8] shows the present total receipts and payments of the Presidency classified under the main heads. The next [9] shows the details of Imperial and Provincial

civil receipts and payments under account heads. The following statement ^[10] shows the incidence per head of population of each large item of Imperial and Provincial civil taxation roughly calculated with a view to all the circumstances; the statement is sufficiently accurate to indicate the proportion between the amounts of the taxes. Vol. II, App. LXXVII, shows the same information in detail by localities. The two lists given in Vol. II, App. LXXXIV, show in full detail all the funds at the disposal of the Madras Government and all the heads of service controlled by them, with the actuals for 1883-84. The two statements at foot ^[11 & 12] show approximately the course of exchange between different parts of the Presidency and between this Presidency and others.

(b) *Imperial.*

642. INTRODUCTION.—The funds and services which may be classed under this head of control are assigned for purposes which are regarded artificially at any rate as having an exclusively imperial interest; and in administering them the Local Government may be considered as acting in the capacity of agents to the Government of India. The funds are enumerated with details as to their nature in part “a” of Vol. II, App. LXXXIV, and the services similarly in part “b.” The roman and arabic figures attached to the items in the appendix relate, as mentioned above, to the Imperial classification employed for budget and general purposes. The Imperial civil budget goes up to the Government of India incorporated with other civil budgets, though it is theoretically distinct. The Accountant-General’s administration report consolidates the figures in the same way. The budgets for the Public Works, Postal, Telegraph, and Military Departments are sent to the Government of India each separately. The following are some general remarks on each of these heads. It has already been observed that the two series of funds and services agree only occasionally, and in a technical sense are entirely apart.

643. CIVIL.—The items under this class since the last decentralization scheme are not numerous. The largest receipt is from tributes and subsidies from the Mysore, Travancore, and Cochin native states. Various salaries are debited to Imperial Civil heads, as can be seen from the appendix. The heads Gain by Exchange and Loss by Exchange are adjusting heads rendered necessary by the fact that the accounts of the Home Government are kept in the English, and those of the Indian Government in the Indian currency. The value of provincial stores, &c., is debited to the proper heads at the fixed rate of exchange, but the per contra credit afforded to the London account is at the rate of 2 shillings per rupee, and the difference between this smaller sum and the debit to Provincial is credited to Gain by Exchange. On the other hand the amount of Secretary of State’s bills drawn on India is debited to account with London at the rate of 2 shillings per rupee, the difference between the smaller sum thus obtained and the larger sum actually paid being charged to Loss by Exchange.

644. PUBLIC WORKS.—The Public Works Department executes works for Provincial and Local Funds as well as for Imperial Funds. A large proportion of the works are however for the latter, and it was for executing these Imperial works that the department was primarily designed. Moreover the Public Works Account Department is to a certain extent an Imperial establishment, the superior officers of the department and all newly-appointed members of the Accountant establishment being available for service in any part of British India. The present remarks relate to Imperial Public Works Finance and Account, but, except in minor details, the procedure with respect to Public Works accounts under Provincial and Local Funds is the same.

645. Two separate budget estimates of Imperial Public Works receipts and charges are prepared annually; one for Irrigation works, including embankment and conservancy of rivers, the other for Military, Postal, and Telegraph works. The irrigation budget is framed by the Chief Engineer for Irrigation in communication with the Superintending Engineers. The budget estimate for Imperial works other than irrigation is prepared by the Chief Engineer, Buildings and Roads Branch, in communication with the Superintending Engineers and the heads of the Military, Postal, and Telegraph Departments. Both budgets, after approval by the Local Government, are submitted about the beginning of January to the Government of India, by whom they are finally passed. In these budgets a specific assignment of funds is made for each of the larger works to be undertaken or continued during the year, and special establishments are estimated for in detail; but the charges for general establishments for administrative and executive purposes are provided for by a percentage on the estimate for works, and repairs are provided for by lump sums placed at the disposal of the local officers of the department. Modifications of the budget are made from time to time during the currency of the year to which it relates. Increases and reductions of the total grants and important transfers can be made only by the Government of India; while transfers of minor importance are made by the Local Government.

646. Each budget, when sanctioned by the Government of India, is virtually a letter of credit in favour of the Public Works Department current during the year to which the budget relates. At the end of the year the credit lapses. On receipt of a budget, the local Accountant-General holds the aggregate amount of the grants at the disposal of the Public Works Department; and to the extent of the aggregate amount of all such grants (including those made in Provincial and Local Fund budgets) he issues letters of credit on the Government treasuries in favour of the disbursing officers of the Public Works Department, on applications made from time to time through the Examiner of Accounts. The Accountant-General regulates only the total issue of letters of credit limiting the total issue to the aggregate of all Public Works grants; the Examiner regulates the issue in detail, limiting the credit of each disbursing officer to the aggregate of assignments made on account of charges to be incurred by him. All miscellaneous receipts realized by a Public Works officer are at once paid into a Government treasury to a separate account against which he is not allowed to draw. The expenditure of each officer is thus limited to the amount of letters of credit granted in his favour; and the aggregate expenditure of the department is therefore limited to the aggregate of all grants made by competent authority. The system of detailed appropriation prevents expenditure on account of any fund in excess of the grant made from that fund. The disbursing officers of the department are the officers in charge of executive divisions and their subordinates. The executive division is the recognized unit; and the officers in charge of these divisions, of which the number is thirty-eight, are the responsible disbursers. It is in their favour that letters of credit are granted on treasuries; and it is they who account to the Examiner for all receipts realized and expenditure incurred within their several divisions. They make such advances as may be necessary to their subordinates, and their subordinates account to them. They also make payments to officers of other departments to enable them to carry out such public works as may be entrusted to them.

647. As just stated, the subordinate executive agents in each division account to the officer in charge of the division for all expenditure incurred by them. Their accounts are of the simplest description, being chiefly copies of their cash-books. The classification of receipts and outlay and the compilation of the accounts of the Executive Engineer and his subordinates into one set of divisional accounts is carried out at the head-quarters of the division; a responsible accountant being attached for this purpose to each division. Every month the Executive officer submits to the Examiner of Public Works Accounts a classified abstract of his receipts and expenditure supported by schedules giving such details as are necessary for statistical purposes. Officers of other departments, technically called Civil officers, who are entrusted with the execution of public works, account every month directly to the Examiner for advances received and outlay incurred by them. The Examiner compiles the accounts received both from Civil officers and from Public Works officers into one general account for the whole Presidency, and submits it to the Accountant-General, Public Works Department. This monthly account of the receipts and disbursements of the department, submitted to the Government of India, is classified under the heads shown at foot.^[13]

648. In the foot-note ^[14] are given the Imperial Public Works receipts and payments for five years.

649. POSTAL.—The receipts and charges of the Postal Department are classified and compiled at the Central Office in Calcutta. The entries in the Madras accounts represent merely the receipts at civil treasuries from, and the payments made to, officers of the department as distinct from the revenue and expenditure of the department. The Director-General of Post Offices in India prepares one budget estimate for all India for the receipts and expenditure of the Postal Department. Within the limit of this estimate, the Comptroller of Post Offices sends the local Accountant-General a monthly requisition statement showing the sums required at each treasury to meet the ordinary establishment charges and the payments to be made on money orders and on account of refunds of Postal Savings Bank Deposits. The Accountant-General thereupon issues the necessary letters of credit on the treasuries. The above remarks do not apply to payments

on account of the district post which is maintained from Provincial Funds. The expenditure on this account appears in its proper place in the Provincial accounts. The receipts and charges of this department for the last five years are shown at foot.^[15]

650. TELEGRAPH.—The arrangements for this department are similar to those just described for the Postal Department, the budget estimate in this case being prepared by the Director-General of Telegraphs in India. The Accountant-General receives a monthly requisition for credits on account of establishment and other charges at the Presidency town and for construction and large repair charges throughout the Presidency. For other charges an annual assignment is granted on each treasury by the Accountant-General at the instance of the Director-General. The receipts and charges of this department for the last five years are shown at foot.^[16]

651. **MILITARY.**—The pay of the Army, both European and Native, and the pay and cost of all military establishments are drawn from Government treasuries. The sums which are entered as military receipts in the Civil Department are separately accounted for, and are not drawn against for these purposes. The estimates of expenditure on account of military establishments and the pay of troops are framed as a budget by the Controller of Military Accounts. When this budget is passed by the Government of India, the Controller applies to the Accountants-General in the several provinces where the Madras Army serves for the grant of cash assignments or letters of credit, subject to its limitation, and under their orders the several treasury officers within their jurisdiction hold in readiness the funds necessary to meet military demands. For British regiments of cavalry and infantry the assignments are made in favour of Regimental Paymasters, who take up their money requirements from the nearest civil treasury; for batteries of artillery, native regiments, and military establishments, the assignments are made in favour of the Presidency Paymaster, who pays on submission of monthly vouchers. Detailed accounts of military expenditure are rendered monthly by the Controller to the Accountant-General, Military Department, with the Government of India. The receipts and charges of this department for the last five years are shown at foot.[1]

(c) *Imperial and Provincial combined.*

652. **INTRODUCTION.**—These form the bulk of the funds and services now controlled by the Government. They are enumerated with details as to their nature in Vol. II, App. LXXXIV and the reason for grouping them together is explained in the preliminary remarks. The budget for these funds and services goes to the Government of India in the general civil budget of the Local Government. The new decentralization arrangements having been in force since 1882-83 only, it is not possible to show receipts and charges separately under this group for a series of years. The following are some remarks as to the more important of the funds and services, as far as they can be dealt with together.

653. **DIFFERENT HEADS OF FUNDS AND SERVICES.**—The receipts under land revenue are revenues of which land is the primary source. They embrace all collections on account of settled demand, the principal items falling under Permanently settled, Ryotwarry, Shrotriem Jody, and Miscellaneous. The item "Permanently settled" consists of peshcush charged on zemindarries, ancient and proprietary, jagheers, mootahs, and polliems. "Ryotwarry" means settlements made directly with the ryots. "Shrotriem Jody" is quit-rent on shrotriem and inam entire villages. Sale proceeds of waste lands, receipts of all kinds on account of redemption of land revenue, and all items of land revenue which are not included in the annual revenue settlement and which are of a fluctuating character, are shown as miscellaneous receipts. Pearl-fisheries are included technically under land revenue. The gross revenue collected in the districts is brought to account; and the practice of liquidating stipendiary allowances, or making any other payments by deductions from the State revenue, is prohibited, except in cases where the special sanction of the Government has been received. Four-fifths of the charges on account of salaries of Collectors and their deputies and assistants, including establishments and contingencies; and the whole of the Settlement, Inam Commission, and Revenue Survey charges appear under this head. The remaining one-fifth of the charges on account of the salaries of Collectors and their deputies and

[1] RECEIPTS AND CHARGES OF THE MILITARY DEPARTMENT FOR FIVE YEARS.

Years.				Receipts.	Charges.	Difference.
				RS.	RS.	RS.
1879-80	19,43,894	2,96,95,652	+ 2,77,51,758
1880-81	19,12,696	2,84,37,061	+ 2,65,24,365
1881-82	18,95,789	2,68,03,400	+ 2,49,07,611
1882-83	18,86,320	2,69,36,345	+ 2,50,50,025
1883-84	20,92,224	2,64,88,630	+ 2,43,96,406

assistants including establishments and contingencies is exhibited under "Law and Justice." The incidence of land revenue in the different districts is shown in Vol. II, App. LVII.

654. The head, Excise on Spirits, &c., otherwise called Abkarry, exhibits on the receipt side all taxes, duties, and fees levied on the manufacture, distillation, or sale of spirituous, intoxicating liquors and drugs. The charges are mainly for establishment and the cost of manufacturing or purchasing liquors in the town of Madras.

655. The receipt head of Assessed Taxes is opened for collections under assessed taxes levied imperially. When the income-tax was in force the receipts consisted of collections levied on personal incomes, profits, &c. The income-tax was first introduced in 1860, discontinued in 1865, revived in 1869, and discontinued again in 1872. The rate varied from year to year, and in 1871-72 it was one per cent. and affected only incomes exceeding 750 rupees per annum. The revenue from income-tax raised in this Presidency between 1860 and 1871 was as shown at foot.^[18] In 1872-73 the tax was levied on incomes exceeding Rupees 1,000 per annum at 2 pies in the rupee or $1\frac{1}{4}$ per cent. under Act VIII of 1872. The tax was collected by the land revenue establishments, but a small additional expenditure was incurred every year on account of the salaries of clerks employed for keeping accounts and assisting the Collectors in issuing processes. The corresponding tax now in force is the License-tax under Madras Act III of 1878, with similar departmental arrangements.

656. Transit, import, and export duties, and fees, fines, and forfeitures in the Customs Department are shown as receipts under the head of Customs. It is sub-divided into two sections, Sea Customs and Land Customs; the first including import and export duties, and the second transit and frontier duties. The charges exactly correspond.

657. The sale-proceeds of salt and collections connected with the salt monopoly, including departmental fines and fines imposed and collected by the Criminal Courts as punishments for infractions of the laws relating to the salt revenue and refunds on account of unexpended charges, &c., and the excise duty levied upon salt manufactured and sold under license by private persons in the South Canara district are shown as receipts under this head. Sea and land customs duty on salt is also brought to account under this head. To this head are debited charges connected with the manufacture and storage of salt and of its superintendence; the salary and allowance of fixed and temporary officers employed in the department, with their establishments and contingencies; charges for police guards; the compensation paid for lands taken up for the manufacture of salt; and other ordinary and extraordinary expenditure arising out of the trade. The construction and repair of petty works exclusively for the benefit of the department or for the convenience of the traders and others resorting to the salt depôts on business are also here debited.

658. Sale-proceeds of stamps of the Stamp Department, stamp duties and penalties levied on unstamped or insufficiently stamped deeds, together with any other sundry receipts which may be connected with the department, are credited to the head of Stamps. Recoveries made for cost of suits 'in formâ pauperis' are credited to Law and Justice. The charges include commission to licensed vendors, and all charges incidental to the department.

659. Under the receipt head of interest is shown interest received on advances on arrears of revenue and on loans to public bodies, native states, or private

[18] AMOUNT COLLECTED FOR INCOME-TAX:

1860-61	{ 4 per cent. on incomes above 500 rupees and 2 per cent. below that	5,42,914	1866-67	6,70,548
1861-62	Do. do. do. ...	25,48,110	1867-68	13,911
1862-63	3 per cent.	23,18,250	1868-69	215
1863-64	Do.	16,46,522	1869-70	1½ per cent.	11,58,231
1864-65	Do.	14,65,652	1870-71	3½ do.	23,33,147
			1871-72	1½ do.	9,88,593

individuals. There is also a charge head bearing a corresponding name, with charge for interest on Service Funds, Savings' Bank Deposits, and certain local loans on which the Government has agreed to pay interest.

660. Under receipts in aid of superannuation are included subscriptions to the defunct Military and Medical Service funds, and contributions for pensions and gratuities made by officers lent for foreign service or employed by the Court of Wards, together with the capitalized value of pensions granted to Local Fund employes; these are the principal items. The charges under the head Superannuation consist simply of pensions and gratuities to Government servants in the several departments.

661. Refunds represent repayment of revenue or receipts erroneously collected. The most important at present are land revenue and stamp refunds, and refunds of Magisterial fines ordered by Appellate Courts. Drawbacks represent the portion of customs revenue due by law to the exporter or importer for re-exportation or re-importation.

662. The charge head of Administration embraces salaries and allowances of the Governor and Members of Council; the household establishment of the Governor; the tour expenses of the Governor; the establishment of the Board of Revenue; the Secretariat establishments of the Government, excepting Public Works Department but including Translators' Offices; the establishment of the offices of Account and Audit; the charges connected with the Currency Department; and the payments made to the Bank of Madras for conducting Government Treasury and Savings' Bank business, and for the management of the public debt.

663. The head of Minor Departments is a charge head, and comprises the charges of the smaller departments engaged in administration not specified in separate heads. For instance, Meteorology, Public Observatories, Examinations, Emigration, Cinchona and Tea plantations and nurseries, Census, Public Exhibitions and Fairs, Gazetteer, Donations to scientific societies, &c. All expenditure connected with the improvement and development of the resources of the country comes under this head.

664. Allowances and Assignments is the charge head for allowances and assignments under political treaties and public engagements. The sub-heads are Territorial and Political Pensions, Inamdars, Pensions in lieu of resumed lands, Compensations, Charitable allowances, and Miscellaneous.

665. Public debt is the generic term for accounts kept (1) of debt incurred by the Government temporarily or permanently, and of debt discharged by the Government; (2) of loans and advances made by the Government and of debts owing to Government; (3) of receipts and payments which are recovered under the provisions of the law and otherwise in the public accounts, but which are not payments due by Government or revenue; (4) of certain funds not incorporated in the public accounts, namely, Municipal, Port, Educational Building, Endowments, and Cantonment Funds; and (5) of remittance transactions between the various Governments and departments in India.

(d) *Provincial.*

666. INTRODUCTION.—These items in which the Supreme Government has no direct financial interest are less numerous than the last class. Otherwise the same remarks apply as in that case.

667. DIFFERENT HEADS OF FUNDS AND SERVICES.—The receipts under Law and Justice include all fees, fines, and forfeitures of the Judicial and Magisterial Departments, including those imposed by Judicial officers and officers of other departments acting magisterially under the Abkarry and Stamp Acts; sale-proceeds of unclaimed and intestate property; and fees when realized in cash. The charges comprise the following:—High Court, including Sheriff of Madras; Law Officers; Administrator-General; Coroner's Court; Justices of the Peace; Civil and Sessions Courts; Courts of Small Causes; Criminal Courts (including the

one-fifth charges referred to under Land Revenue); Special Assistants and Governor's Agents; and Cantonment Magistrates.

668. The receipts under Forest include sale of, and seigniorage on, timber, including drift and waif wood, rent of sandal-wood farms, sale of smuggled wood, &c. Fines under the Forest Law, when levied by Magisterial officers, are credited to "Law and Justice," and when levied by Forest officers, without the interposition of the Magistrate, are credited to "Forest Revenue." The establishments, contingencies and working expenses of the Forest Department come here as charges. Establishments and contingencies are paid for like any other cash charges; working expenses are defrayed by cheques drawn by Forest officers, the amounts being charged direct to the Forest grant, and adjusted in due course by detailed bills. Roads made exclusively for the development of Forest revenue are treated as Forest charges. The head Police gives on the charge side the cost of the Inspector-General of Police and of the entire Force employed at the Presidency Town and in the districts, the portion of it defrayed by Railways and other public or private bodies being credited per contra. The charge head Education gives the salaries of the Director of Public Instruction and Inspectors of Schools and their establishments as well as the cost of all Colleges and Schools including Grants-in-aid and other charges, the fees levied from pupils being credited to the receipt head of Education. The charge head Medical likewise gives the salaries of the Surgeon-General with the Government of Madras and of the Commissioned and Warrant Medical Officers and Subordinates employed in the Civil Department and in Civil hospitals and dispensaries as well as the charges of the Sanitary Commissioner and the Vaccine Department, recoveries of portions thereof from Municipalities and from patients resorting to hospitals being credited to the receipt head of Medical. The Cattle Pound Fund was originally inaugurated under the Imperial Act III of 1857, which was repealed by Act I of 1871. The income of the fund is made up of fines paid on stray cattle and sale-proceeds of unclaimed cattle. It is expended in the remuneration of pound-keepers and in the construction and repair of pounds, and the net surplus remaining is required by law to be applied to the construction and repair of roads and bridges and to other purposes of public utility. A half of the surplus is paid to Local and Municipal funds for these purposes, and the other half is appropriated to the Government farms at Sydapett for agricultural education, &c. A separate account is kept of the receipts and disbursements in view to making the distribution of the balance above described. Otherwise the receipts are so entirely at the disposal of the Government for general purposes that it would not be necessary to treat them as constituting a fund any more than education receipts or medical receipts. In 1871-72 4,594 pounds were maintained, which increased to 5,616 in 1877-78, and to 5,827 in 1882-83. The pounds are very unequally distributed over the districts, as a condition of the establishment or retention of a pound is that it shall be self-supporting. As regards establishment, the head of the village is by law the ex-officio pound-keeper. In 1875-76 Government fixed the remuneration of pound-keepers, as to which great diversity of practice prevailed, at a uniform rate of 50 per cent. on collections for all districts except the Neilgherries. In 1874 Government allowed the employment of a pound goomasta on 10 rupees a month in such of the talooks of each district in which one may be considered necessary, and these are now being gradually entertained.

(e) *Local.*

669. INTRODUCTION.—These funds and services have no separate numbers attached to them in the Imperial scheme of accounts, but items composing them are credited and debited to various heads in that scheme. The items however are given separately with the word "Local" marked against each.

670. DIFFERENT HEADS OF FUNDS AND SERVICES.—A description of the nature of the Local Funds lately under Madras Act IV of 1871 and now under Madras Act V of 1884 and of the Boards which administer them has been given under Chapter III. A general supervision only is exercised by the Local Government, and the funds may be described as funds raised locally, administered locally, and administered

for strictly local purposes. The balance sheet at foot [19] for 1883-84 will show the ordinary heads of receipts and charges.

671. The assets of the Village Service Fund are derived chiefly from the cess collected with the land revenue under Madras Act IV of 1864 in the districts where the Act has been introduced, from the deductions made from the land revenue in some districts on account of village service and which the Government are pledged to continue for various reasons, and from the sums charged for the enfranchisement of village service inams. In districts, where the Act has not been introduced, the old mirass or fees paid by the people as remuneration to the village officers are collected and credited to the fund. The object of the fund is to improve the pay of the village servants, and to increase and alter their number so as to meet properly the requirements of the different villages. Act IV of 1864, which is introduced concurrently with the new settlement in each district, is as yet in operation only in Godavery, Kistna, Kurnool, Trichinopoly, Salem, Chingleput, Nellore, Cuddapah, North Arcot, South Arcot Neilgherries, South Canara, and Tinnevely. The rates of cess levied are as follows:—Godavery, 8 pies; Kurnool, 10 pies; South Canara, 6 pies; and all the other districts one anna. As the cess was collected before the re-organization of the village establishments, there are large surpluses in a few districts.^[20]

672. An irrigation cess is paid voluntarily by ryots holding lands under certain river-channels in lieu of customary labor formerly supplied by them. It exists in Trichinopoly, Tanjore, Salem, and Coimbatore. It has gradually died out in Madura owing to the want of any law to enforce the payment.

673. The Canal and Ferry Fund is raised under Madras Act I of 1870, and is made up of tolls and license fees on canals, lines of navigation, and ferries. The money is expended on the construction, improvement, repair, maintenance, and

[20] VILLAGE SERVICE RULES HAVING THE FORCE OF LAW.—Under Act IV of 1864, section 11 (Cess in lieu of village fees), the following have the force of law:—Extension of Act to (1) Trichinopoly district—Fort St. George Gazette, 20th December 1864. (2) Godavery district. (3) Kurnool district—Fort St. George Gazette, 15th June 1869. (4) Salem district—Fort St. George Gazette, 21st March 1871. (5) Tinnevely district—Fort St. George Gazette, 26th November 1872. (6) Sydappett talook, Chingleput district—Fort St. George Gazette, 9th March 1876. (7) Other talooks of Chingleput district—Fort St. George Gazette, 5th August 1879. (8) Masulipatam portion of the Kistna district—Fort St. George Gazette, 6th August 1878. (9) Nellore district—Fort St. George Gazette, 18th March 1879. (10) Re-imposition of cess in four talooks of Tinnevely in which it had been suspended—Fort St. George Gazette, 22nd June 1880. (11) Reduction of cess in two villages in Ambasamoodram talook, Tinnevely district—Fort St. George Gazette, 10th August 1880. (12) Cuddapah district—Fort St. George Gazette, 4th January 1881. (13) Wallajahpet talook, North Arcot district—Fort St. George Gazette, 13th June 1882. (14) Chidambaram talook, South Arcot district—Fort St. George Gazette, 19th September 1882. (15) South Canara district—Fort St. George Gazette, 5th December 1882.

extension of the channels and ferries to which the provisions of the Act may be applied. As yet the Act is in operation only as regards certain ferries in the Godavery, Kistna, Tanjore, Malabar, South Canara, Cuddapah, South Arcot and Trichinopoly districts, and the salt canal from Negapatam to Vedaranyam, to which it was extended in 1874-75.^[21]

674. The District Road Fund of Bhadrachellam and Rekapully talooks is formed by a cess of 2 per cent. levied on the land revenue, and is expended in making roads. The fund came into the Madras books on the transfer of the two talooks from the Central Provinces in 1874-75.

(f) *Excluded.*

675. INTRODUCTION.—These funds and services are excluded altogether from the accounts in the Imperial scheme, for the reasons already stated.

676. DIFFERENT HEADS OF FUNDS AND SERVICES.—Municipalities merely bank with the Accountant-General, and he has no account of their receipts and charges. Municipal administration is treated of under chapter III of this volume.

677. The Port Fund consists of dues and fees levied under Act XII of 1875, and from it a portion of the port establishments and other charges are defrayed. This fund is constituted under section 47 of the Indian Ports Act. The rules and notifications under the Act which have the force of law have been shown under the article "Marine." To this fund are also taken the receipts and charges under the Madras Harbour Dues Act VI of 1882 and the Cocanada Port Dues Act III of 1883.

678. The Cantonment Fund is formed under section 19 of Madras Act I of 1866, and its revenue is derived from funds levied under section 17 of the Act, from pound collections and sale of grass and other produce reared within the cantonments. The fund is expended on sanitary establishments and works of public utility within each cantonment. The rules having the force of law made under sections 17, 19 and 40 of the Act are given in the article "Military."

679. The University Fee Fund is formed under Section XV of Act XXVII of 1857 and consists chiefly of fees levied from the Candidates for the several University Examinations, the charges whereof are met from the fees.

[21] CANAL AND FERRY RULES HAVING THE FORCE OF LAW.—Under Act I of 1870, sections 2, 5, 14, 20, 22, 23 and 31 (Canal tolls and ferries), the following have the force of law:—(1) Sections 2, 14 and 5—Application of Act to certain ferries in the Tanjore district and Scale of Fees—Revenue Notifications, Fort St. George Gazette, dated 17th January 1881, and 21st May 1872. (2) Section 2—Application of Act to Vedaranyam canal in the Tanjore district—Revenue Notification, Fort St. George Gazette, 30th June 1874. (3) Section 23—A rule issued for ferries in the Tanjore district—Revenue Notification, Fort St. George Gazette, 15th December 1874. (4) Sections 2 and 14—Application to certain ferry in the South Arcot district and Scale of Fees—Financial Notification, Fort St. George Gazette, dated 11th March 1873. (5) Application to certain ferries in Kistna district and Scale of Fees—Revenue Notification, Fort St. George Gazette, dated 4th June 1872; dated 15th June 1880; dated 14th December 1881. (6) Application to a certain portion of the Kistna river in the Kistna district, and Scale of Fees—Revenue Notifications, Fort St. George Gazette, dated 23rd August 1870; dated 16th May 1871. (7) Application to a certain ferry between the Godavery and Kistna districts and Scale of Fees—Revenue Notification, Fort St. George Gazette, 19th July 1881. (8) Section 22—Ferry rules applicable to the Kistna district—Revenue Notification, Fort St. George Gazette, 4th January 1881. (9) Sections 2, 14 and 22—Application to certain ferries in the Godavery district and Scale of Fees and Rules—Revenue Notifications, Fort St. George Gazette, 15th September 1874, and 30th June 1874. (10) Extension to certain ferries in the South Canara district and Scale of Fees and Rules—Revenue Notifications, Fort St. George Gazette, 21st January 1879, and 17th February 1880. (11) Application to certain ferries in the Malabar district and Scale of Fees and Rules—Revenue Notifications, Fort St. George Gazette, 18th February 1879; 17th February 1880; and 25th January 1881. (12) Application to certain ferries in the Trichinopoly district and Scale of Fees and Rules—Revenue Notification, Fort St. George Gazette, dated 4th January 1881. (13) Application to certain ferries in the Cuddapah district and Scale of Fees and Rules—Revenue Notifications, Fort St. George Gazette, dated 5th October 1880, and 7th December 1881. (14) Section 23, rules for the regulation of the navigation of the Buckingham Canal—Public Works Department Notifications, Fort St. George Gazette, dated 17th September 1880, and 23rd February 1881. (15) Revised Rules for the regulation of the navigation of the Godavery and Kistna Delta canals—Public Works Department Notification, No. 35; Fort St. George Gazette, dated 13th June 1882. (16) Sections 2 and 22, application to certain canal in the Cochin Municipality and Rules—Financial Notifications, Fort St. George Gazette, dated 1st February 1882, and 23rd March 1882. (17) Rules for the regulation of the Canal Traffic at Ellore, Bezvada and head of Eastern Delta Canals—Public Works Department Notification, Fort St. George Gazette, dated 18th April 1882. (18) Section 31, Delegation of powers conferred on the Governor in Council by certain sections to Collectors of Districts to which this Act is extended—Revenue Notification, Fort St. George Gazette, 25th July 1871. (19) Extension of Act and Rules to ferry at Kuttakadavoo, Ponnany talook, Malabar—Fort St. George Gazette, 25th January 1881. (20) Extension of Act to ferry between Penoomoody in the Repally talook to Avanigadda in the Bunder talook, Kistna district—Fort St. George Gazette, 19th July 1881. (21) Chennai and Sidhout ferries, Cuddapah—Revised Scale of fees for conveyance of goods across the—Fort St. George Gazette, 7th December 1881. (22) Salempalem ferry—Act extended to the—Fort St. George Gazette, 14th December 1881. (23) Addition to exemptions in the Kistna rules—Fort St. George Gazette, 8th August 1882. (24) South Arcot—Act extended to—Fort St. George Gazette, 12th September 1882. (25) Tinnovely—Extension of Act to certain ferries in—Fort St. George Gazette, 19th December 1882. (26) Kistna—Extension of Act to certain ferries in—District.

LOANS AND ADVANCES.

680. DESCRIPTION.—Corporate bodies having a control of public funds are empowered under India Act XI of 1879, the Local Authorities Loans Act, to obtain money on loan from the local Governments, or with the consent of Government from private parties, on the security of those funds. They cannot raise money on loan otherwise, unless indeed they have a special enactment enabling them to do this as in the case of the Madras Municipality. The objects for which such loans may be raised are the construction and repair of works of public utility, or the repayment of debts contracted before the passing of the Act for the same purposes. It has been ruled that the works must be of a reproductive character, in all cases except where the borrowers are municipal bodies; in this case a greater latitude is allowed, mostly on account of the greater urgency of sanitary reforms in towns, which nevertheless are very seldom remunerative. Loans bear interest at the rate agreed upon, and are repayable ordinarily by half-yearly instalments within twenty years. If any of the loan conditions are infringed, the funds of the corporation are liable to attachment by Government. The loans are given at the discretion of the local Government, not exceeding Rupees 5,000 in each case. Under section 5 of the Act Government of India Notification, dated 17th August 1883, published in the Fort St. George Gazette of the 4th September 1883, gives rules having the force of law. Two lakhs of rupees are annually entered in the budget estimate of this Presidency to meet advances for agricultural improvements under India Act XIX of 1883, the Land Improvement Loans Act. This sum is distributed between the districts by the Board of Revenue, and from the sums so allotted Collectors make advances to the ryots under rules now under preparation. These advances bear interest at the yearly rate of one anna per rupee. Advances are sanctioned not under legal enactment for the relief of persons suffering from some temporary calamity as the destruction of houses or crops or seed grain or agricultural stock by some calamity of season or by fire or flood, or for some miscellaneous object. The advances cannot exceed Rupees 2,500 in any single case or Rupees 25,000 in all during the year. These advances are ordinarily repayable in not more than 20 equal half-yearly instalments including interest at $6\frac{1}{2}$ per cent. per annum. Loans are again in special cases given by the Government of India to zemindarry estates, &c., on terms specified when each loan is sanctioned. The statement at foot gives a list of persons and corporations to whom loans have been granted by the Government in this Presidency, with particulars.[1]

[1] LOANS GRANTED BY GOVERNMENT IN THIS PRESIDENCY AND STILL RUNNING.

Persons and corporations to whom loans have been granted.	Under what Act, &c.	On what account.	Amount of loan sanctioned.	Rate of interest.
Madras Municipality..	Madras Act No. IX of 1867 ..	For water-supply project, 1869, 1873.	RS. 14,30,000	RS. 4
Negapatam do. ..	India Act No. XXIV of 1871..	For the construction of a market, 1874.	25,000	4½
Ootacamund do. ..	Do. do. ..	For the completion of certain roads and water-supply channels, 1875.	12,420	4½
Mangalore do. ..	Do. do. ..	For improvement to market, 1875-76.	9,150	4½
Coimbatore do. ..	Do. do. ..	For erecting tiled houses ..	2,000	5
Coonoor do. ..	Do. do. ..	For erecting market-sheds, 1875 ..	7,248	4½
Sydepatt Local Fund Board.	Do. do. ..	For construction of an iron girder bridge across the Corteliaur, 1873, 1876.	1,99,700	4½
Calicut do. ..	Do. do. ..	For completion of the Tambracherry ghaut road and approach in Wynaud, 1874.	89,000	4½
Tellicherry do. ..	Do. do. ..	For completion of the Peria ghaut road and construction of a fair weather road in Wynaud, 1875.	80,000	4½
Ramnaud Zemindarry ..	India Government Order ..	For liquidation of debt, 1873 ..	12,72,830	5
Bungnapully Nawab ..	Do. do. ..	For liquidation of debts and repairs and improvements, 1873, 1877.	3,00,000	5
Jagheerदार of Sundoor..	Madras Government Order ..	For roads, 1873 ..	2,500	4
Sivagunga Zemindarry.	India Act No. XXVI of 1871 ..	For repairs to irrigation works ..	1,60,000	6½
Talavancottah do. ..	India Government Order ..	For liquidation of debts and repairs to irrigation works, 1880-81.	55,000	4½

PAPER CURRENCY DEPARTMENT.

681. PAPER CURRENCY.—The public advantages of a paper currency, in substituting a cheap and convenient instrument of circulation in place of an unwieldy and costly silver coinage require no exposition. The manner in which the Government make the undertaking profitable will be deduced from the history of Governmental operations shown in the foot-note.[¹] The present Currency Act

Persons and corporations to whom loans have been granted.	Under what Act, &c.	On what account.	Amount of loan sanctioned.	Rate of interest.
Chintalaputty Vantoo ..	India Government Order ..	For the restoration of an old irrigation channel, 1880.	Rs. 10,000	Rs. 6½
Andiputty Poligar ..	Do. do. ..	For liquidation of debt, 1881, 1882.	62,000	6

[¹] SKETCH HISTORY OF INDIAN PAPER CURRENCY.—The three Presidency Banks established under Government control at Calcutta, Madras, and Bombay, used for many years to employ a private note circulation under the terms of their charters. Under India Act IX of 1843 the Madras Bank could so issue bank notes of not less than 10 rupees each to an aggregate of one crore of rupees. There was no law however to provide for a reserve against this note-issue, nor were the notes made legal tender; the circulation of the notes therefore extended only a short distance into the country. The total amount for the three banks never exceeded five millions sterling. (2) This was the state of things when Mr. Wilson came to India in 1860, and unfolded his measure for a Government paper currency, to be made legal tender, and the reserve to be protected by law. He was opposed to the ordinarily accepted English principle of the Bank Charter Act of 1844. That principle may be thus described. The Government employing the Bank of England as its agent coins the paper currency, for which it receives cash in exchange. As a guarantee for solvency in repaying the note on demand, the bank holds, first up to a fixed amount of 15 millions either its own promises to pay or Government securities for which it has already given cash, and secondly after that bullion of the exact amount of the further note-issue. The profit of the Government in this case consists in paying no interest on its own promises to pay, which nevertheless it permits itself to regard as convertible security. The security of this amount is in fact the credit of the Government. The fixed amount of 15 millions is supposed to be the extent of the notes which will be out in circulation at any one time, and for which therefore it is unnecessary to have a bullion equivalent. The principle with the Scotch and Irish private banks is the same; they can issue notes up to a certain amount without any deposit of gold, but after that they can issue only on a corresponding cash reserve. The German Government have recently adopted the English system of paper currency, providing however that on payment of a fine to the State of 5 per cent. the fixed limit may be transgressed without recourse to a cash reserve. (3) Mr. Wilson was opposed to that part of the English principle which gave a fixed limit to the notes not protected by cash, and would have substituted the American method of allowing this portion of the notes to vary always with the total amount of the notes. The arrangement then is to take first the cash reserve and prescribe that it must bear a certain proportion to the whole value of notes, in Mr. Wilson's proposals one-third; and to allow the whole remainder of the notes to be represented by securities. It will be seen that this is an inversion of the English method; and that while in the case of the English Act the amount of unbacked notes is the amount which is found practically safe from the point of view of trade, in the case of the American Act the amount of unbacked notes may rise to any numerical figure according to the expansion of the currency. Mr. Wilson looked to a large expansion of the Indian currency and a correspondingly large saving to the Government in the interest on their own securities. The Act would of course make the notes legal tender within certain limits. There were to be seventeen currency circles. Within each circle the notes were to be encashable at certain places. The gain to Government by saving interest is supplemented in these cases by the items of economy of coining and economy of transport, the latter being in India a very important consideration. (4) Mr. Wilson died before his scheme was completed. Mr. Laing, who succeeded him, reverted to the English system of reserves, but he adopted his predecessor's scheme of sub-dividing the empire into circles of legal tender and encashment. The amount then fixed as the sum for which securities were permissible was 4 crores of rupees, or 4 millions sterling. The coin received for all notes in excess of this limit was to be held in reserve by the Currency Commissioners. Mr. Laing further proposed to reduce the number of currency circles to three, Calcutta, Madras, and Bombay, and to develop the note circulation through the agency of the Presidency Banks. Sir Charles Wood, who was then Secretary of State for India, disallowed that part of the scheme which contemplated the employment of the banks, and required that the management of the currency should be undertaken directly by the Government. Some delay arose on this account and at the time when Sir C. Trevelyan succeeded Mr. Laing in 1862 little had been done in the matter beyond issuing Government notes at the Presidency towns, in lieu of those withdrawn by the banks. The measure finally carried out during Sir C. Trevelyan's tenure of office; viz., India Act XIX of 1861, embodied the arrangements just mentioned, but the number of circles was fixed at ten and Rupees 10 was to be the lowest value of note. This Act was repealed by India Act III of 1871, which increased the sum of 4 crores to 6 crores, and instituted 5-rupee notes. Other Acts repealed by this were I of 1868, XXX of 1867, and XV of 1870, there being different amendments of XIX of 1861. Act XX of 1882 (The Indian Paper Currency Act) in force at present repeals Act III of 1871, but the only difference between the two Acts is the establishment of an office of issue at Rangoon, in addition to those in India. (5) The average circulation of notes has risen from about 4½ millions in 1862-63 to about 16 millions in 1882-83, the rise having been gradual. The expansion of the Government paper currency may be regarded as satisfactory, though of late years the rate of growth has been slight. The increase is chiefly at the various trade centres, but there is also some circulation, amounting to about 2½ millions sterling in the interior of the country. The fluctuations in the circulation have been for the most part inconsiderable, and there never has been any contraction or fall indicating public distrust. The reasons why the Indian paper currency has so far had a comparatively limited circulation appear to be of two kinds: first, the denominations of note employed are not suited to the circumstances of the people; secondly the note is practically inconvertible throughout the greater part of the country. As to the first point, the introduction of notes of as small a denomination as one rupee appears to be required; and the retail trade of India is carried on in such a minute detail as regards individual transactions, that even this would be too large effectually to answer the purpose. The reasons for the practical inconvertibility of the notes are the extent of the circles of issue and the absence of means for cashing notes. The natural remedy for this would be to make the notes payable on presentation at every district treasury throughout the country. This would necessitate an increased transmission of specie into the interior, but it is supposed by some that the cost would be recovered in the profits of the paper currency. The ultimate aim here doubtless is the abolition of currency circles and the establishment of a universal note for all India.

(India Act XX of 1882) divides the whole country into circles of issue, and appoints some one city or town in each as the place of issue of notes. It provides that a currency note shall be a legal tender within the circle of issue in payment of any revenue or other claim, to the amount of five rupees and upwards due to the Government of India, and in payment of any sum of five rupees and upwards due by the Government of India or by any body corporate or person in British India, "provided that no such note shall be deemed to be a legal tender by the Government of India at any office of issue." It further provides that all notes shall be legally payable on demand at the office of issue of the circle and at the Presidency town of the Presidency within which the town or city of issue is situated; that the whole of the bullion and coin received for notes issued shall be retained and secured as a reserve to pay such notes, with the exception of such an amount not exceeding sixty millions of rupees as the Governor-General in Council, with the consent of the Secretary of State for India, shall from time to time fix: the amount so fixed being invested in Government securities; and that the coin bullion and securities shall be appropriated and set apart to provide for the satisfaction and discharge of notes in circulation. Suitable measures are taken in the Act for providing for a careful audit of the currency accounts and for the preparation monthly, for publication in the Gazettes of Calcutta, Madras and Bombay, of an abstract of the accounts of the department, showing the whole amount of notes in circulation, the amount of coin and bullion reserved, and the amount of the Government securities held by the department. The details of the law are shown under the head of "Paper Currency" in Vol. II, App. LIV.

682. The issue of currency notes is entrusted to a special department styled the department of Paper Currency, presided over by a Head Commissioner of Paper Currency with a Commissioner, or Deputy Commissioner of Paper Currency for each circle of issue, the appointment and removal of these officers being vested by law in the Government of India. The Madras Presidency is divided into two circles of issue, the Madras circle and the Calicut circle, both under the control of the Commissioner of Paper Currency, Madras, assisted by a Deputy Commissioner for the Calicut circle. The post of Commissioner of Paper Currency, Madras, is held by the Accountant-General, the post of Commissioner or Deputy Commissioner being as a rule held by the Chief Civil Account Officer of the circle. The Calicut circle of issue includes the districts of Malabar, South Canara, Coimbatore, the Neilgherries, and Coorg, having Calicut as the office of issue. The Madras circle includes all the other districts, with the town of Madras as head-quarters for the issue of notes for the circle. There were formerly a Trichinopoly and a Cocanada circle, the former embracing the districts of Tanjore, Trichinopoly, Madura, and Tinnevely, with head-quarters at Trichinopoly, and the latter, the districts of Ganjam, Vizagapatam, Godavery and Kistna, with head-quarters at Cocanada. The Trichinopoly circle was abolished on the 31st October 1872, owing to the Bank of Madras having withdrawn its branch from that station, and the Cocanada circle was abolished on the 16th August 1881, the circulation having been found to be confined almost entirely to the Madras Bank, and there being hardly any public demand for the notes. In addition to the two head-quarters of issue, currency agencies are established at Vizagapatam and at Cocanada to afford facilities to the public for exchanging coin for notes, or notes for coin. At the head-quarters of each circle of issue, notes of the circle are issued for coin or other notes of the circle, and coin for notes of other circles (styled foreign circle notes). Foreign circle notes are not encashable by law, but the practice is to cash them whenever the reserve of silver coin admits of it, that is to say, whenever the reserve is in excess of the circulation of the circle after deducting the minimum circulation. Madras being the Presidency town, the issues of the Calicut circle and of the agencies within the Presidency are also encashable there by law. Though legally encashable on demand only at the office of issue, notes of the Madras circle are as a rule cashed on demand at most of the treasuries and sub-treasuries in the Presidency. The revenue of the Presidency being remitted almost entirely to Madras, the city of issue, the encashment at the treasuries is as a rule a mutual convenience to the Government and to the public. It is further the practice of Government to receive notes of any issue in payment of its dues, and to require

the railway companies similarly to receive notes of any issue in payment of railway fares and of freight.

683. The subjoined statement [¹] shows the average circulation of currency notes in the Madras Presidency and throughout India from the year 1862, the date of the establishment of the Government Paper Currency Department, to the end of 1882-83. The circulation of the banks in 1861 amounted to about three-and-a-half crores of rupees. The circulation of notes in the Madras and Calicut circles, excluding those held in the branch reserve treasury, was 127 lakhs at the end of 1883-84. The coin reserve held in the Presidency at the end of 1883-84 was 108 lakhs. The receipts and issues of home notes during that year amounted to 1,642 lakhs, and the encashment of foreign notes to 86 lakhs. The profit to Government on the currency operations of the year was Rupees 2,03,261.

684. GOVERNMENT SECURITIES.—The operation of the ordinary Government of India securities is familiar, and need not here be described. In the foot-note [³] are given brief particulars as to each of the loans now running. A new kind of

[³] LIST OF PUBLIC LOANS ISSUED BY THE GOVERNMENT OF INDIA AND NOW RUNNING.—Three-and-a-half per cent. loan of 1853-54.—Opened 28th October 1853 and closed 30th August 1856—interest payable on 28th February and 31st August. Four per cent. loan of 1854-55.—Advertized for discharge on 27th March 1882, vide Financial Notification, No. 2122, dated 24th December 1881. Four per cent. loan of 1855-56.—Advertized for discharge on 27th March 1882, vide Financial Notification, No. 2122, dated 24th December 1881. Four per cent. loan of 1856-57.—Opened 7th June 1856 and closed 16th September 1856—interest payable half-yearly on 1st May and 1st November as in the above loans. Notes of this loan have partly been transferred to the four per cent. loan of 1st May 1856. Four per cent. loan of 1856-57.—Opened 16th September 1856 and closed 15th May 1861—interest payable half-yearly on 31st March and 30th September as in the above loans. Four per cent. loan of 1857-58.—Opened 4th January 1858 and is comprised of cash subscriptions and transfers from the five per cent. loans of 1855-56 and 1856-57—interest payable on 1st February and 1st August. The other conditions of this loan are the same as those of the four per cent. loan of 1856-57. This loan is open for the consolidation of notes of the several four per cent. loans to notes of a corresponding amount in it. Four per cent. loan of 1858-59.—Opened 28th October 1858, and is comprised of transfers from the five per cent. loan dated 30th June 1841—interest payable on 30th June and 31st December. Four per cent. loan of 1859-60.—Opened 22nd January 1859 and is comprised of transfers from the five per cent. transfer loan. Four per cent. transfer loan of 1st May 1855.—Opened 19th November 1854—interest payable on 1st May and 1st November. This loan is open for the consolidation of notes of the several four per cent. loans into notes of a corresponding amount in it. Reduced four per cent. loan of 16th January 1879.—Comprises transfers from the four-and-a-half per cent. transfer loan of 1872 under the provisions of clause 6, para. 3 of Financial Notification, dated 16th September 1871, No. 3206—interest payable half-yearly on 16th January and 16th July. Four-and-a-half per cent. loan of 15th July 1870.—Opened under Financial Notification, dated 31st December 1869, No. 3452, and is comprised of transfers from the five per cent. P.W. loan of 13th March 1855, and four-and-a-half per cent. loan of 28th February 1857—interest payable half-yearly on the 15th January and 15th July. Guaranteed not to be paid off before the 15th of July 1885. Four-and-a-half per cent. loan of 4th July 1871.—Advertized for discharge on 18th February 1882, vide Financial Notification, No. 4034, dated 3rd November 1881. Four-and-a-half per cent. loan of 15th September 1878.—Opened under Financial Notification, dated 27th July 1878—interest payable half-yearly on 15th March and 15th September. No part of this loan will be discharged before 15th September 1893. Transfer loan of 1879.—Comprises transfers from the five-and-a-half per cent. loan of 31st May 1859, and cash subscriptions under Financial Notifications, dated 12th August 1878, 13th March 1879, and 14th May 1880. Notes in lieu of transfers from the five-and-a-half per cent. Loans were issued in two alternative forms, one portion entitled, "The Transfer Loan, 1879. Four-and-a-half per cent. portion," and the other "The transfer loan of 1879. Seven shillings sterling per cent. portion." Interest payable half-yearly on 15th March and 15th September. No part of this loan will be paid off before 15th September 1893.

security termed "Stock notes" was issued by the Government of India in 1882, the object being to afford to the masses of the people in the mofussil greater facilities for the investment of their petty savings at interest and to encourage accumulation. The notes which are of four denominations, viz., Rupees 12½, Rupees 25, Rupees 50, and Rupees 100, are issued at par, and bear interest at four per cent. per annum. Coupons are attached to them for payment of interest, notes of the three lower denominations having each 3, and the 100-rupee note 9 coupons. The amount of interest accruing monthly is for the convenience and security of the public stated on the face of the note and of each coupon. Unlike ordinary Government securities stock notes are transferable from hand to hand without endorsement or any other formality whatever. They may be deposited at the Government treasury where land revenue is payable, and the interest thereon will be credited, as it falls due, to the account of the depositor. Interest on coupons if presented undetached from the notes to which they belong, will also be credited when it has become due, in payment of land revenue or State demands of all kinds, and the notes are also received as security deposits for Government servants, &c. They are obtainable on demand at all district and talook treasuries, and also from post offices, but are not sold at the Presidency towns. Notes of any of the three lower denominations may be exchanged at any treasury for their equivalent in notes of the higher denominations. Stock notes appertain to certain circles of issue and interest is payable annually on presentation of the note on or after 1st February at any of the treasuries situated within the circle to which the note belongs. The transfer of payment of interest from one circle to another is not ordinarily allowed. Interest payable on stock notes is free from taxation of every description, and no stock note will be discharged within twenty years from the date of issue thereof, or without six months' previous notice of intention to discharge. The Madras circle for stock notes comprises the Madras Presidency and Coorg. The sales of stock notes up to the end of 1882-83 amounted for the whole of India to Rupees 16,92,000, and for the Madras Presidency to Rupees 1,84,000.

CHAPTER VI.

VITAL STATISTICS AND MEDICAL SERVICES.

CENSUS.

685. INTRODUCTION.—There will be no further census in this Presidency until the year 1891, and the method of work generally obtaining on such occasions can be inferred from the account of the proceedings in 1881 shown in the sketch history at foot.^[1] The different operations involved in an enumeration were legalized by India Act XIV of 1880. The Commissioners of the Madras Municipality have power to make censuses under Government sanction according to the provisions of their Act. The Indian Arms Act (India No. XI of 1878) authorizes a census of fire-arms to be taken by the local Government on occasion. The census statistics now on record for this Presidency are shown in the following paragraphs. They will form the basis of administration until the year 1891. The same figures are shown in general and tabular form arranged by districts in Vol. II, App. XVI, and a conspectus of census figures for the whole of India will be found in Vol. II, App. XVII. The revenue and population in some of the principal countries of the world, including India, is shown in Vol. II, App. LVI.

[1] SKETCH HISTORY OF CENSUSES IN THE PRESIDENCY.—*Early Censuses.*—The first census of the Madras Presidency was taken in 1822, when the population was returned at 13,476,923. The next enumeration, within the same territorial limits, was in the year 1836-37, when the numbers were returned at 13,967,395, or an increase of only 490,472 in fourteen years, a result doubtless chiefly due to defective census returns, but also attributable in some measure to the epidemic cholera prevailing from 1818 to 1820 or 1827, and to the latter epidemic, preceded by famine, which raged in 1833 and 1834. The first of the quinquennial enumerations was taken in 1851-52, when the population was found to have risen to 22,031,697, of which 273,190 belonged to the district of Kurnool, which had been annexed after the previous census was taken. An increase of 58 per cent. in fifteen years shows that one or other of the censuses was inaccurate, and it is now believed that many of the zemindarries were omitted or their population much understated in the returns for 1836-37. The results of the four quinquennial enumerations are as follows:—1851-52—population 22,031,697; 1856-57—population 22,857,855; 1861-62—population 24,656,509; and 1866-67—population 26,539,052. The figures for 1861-62 and 1866-67 are exclusive of North Canars, which was transferred to Bombay in 1862, with a population at that time of about 300,000. The first regular census was taken in 1871. The preliminary work for this commenced in January 1871, and the final enumeration took place on the night of the 14th November 1871, giving a population of 31,597,872. (2) *The census of 1881.*—The last census of the Madras Presidency was taken on the night of the 17th and on the morning of the 18th February 1881. In that census inquiry was made into certain subjects untouched, or but lightly touched, in the census of 1871. These were the "civil" or conjugal condition of the people, their languages, their birth-places, their occupations, and the sub-divisions of their castes. Of these the first three were wholly new; the other two were taken up more minutely than on the former occasion. Exceeding all other points of interest in the 1881 census was the prominence which the figures in the census tables gave to the effects of the famine of 1876-78. (3) *Procedure of the 1881 Census.*—The procedure adopted at the latest Madras census was as follows:—During the year previous each talook was divided into census circles. There were 3,973 such circles containing sometimes as few as 6, and sometimes as many as 24 villages. The 3,973 circles were divided into 73,059 blocks, each block containing an average of 243 houses. For a collection of circles a superintendent was appointed, for each circle a supervisor, and for each block an enumerator. Five registers were then prepared. Their object was to identify the resident population roughly in advance, and to furnish data as to the providing of due machinery for the enumeration. The statistics thus obtained were also valuable in themselves. A preliminary census extending over fifteen days was then held two and a half months prior to the final synchronous enumeration, with a view to providing rough drafts of the final house-to-house returns. In this country entries are seldom made by the inhabitants themselves, and if a rough draft was not prepared in advance, the work could not be executed in a single day and night. It is found by experience that the resident population shift little between the preliminary enumeration and the final census, and much correction at the latter date is not necessary. The preliminary enumeration may in fact be regarded as a register of ordinary house-occupyings. The interval between this and the final census was necessary for check, but on future occasions it can be much diminished. The final census embraced both the resident and the floating population, and was a return for the night of the 17th February 1881. In certain special localities the census was omitted, and reliance was placed on the preliminary enumeration. In counting the floating population an attempt was made to prevent double counting by serving a ticket on each person who had been counted, with instructions to produce it if addressed again. The floating population comprised the homeless poor and travellers by road, railway travellers, the canal population, the boat population on the west coast backwaters, the sea-going population within Indian waters, and soldiers on the march. Special arrangements were made for each of these classes. The census was taken mainly by the Revenue department, but other departments gave assistance. The schedules or house-to-house returns were finally sent in to the central office at Madras, and there abstracted, posted, and tabulated. The arrangements for checking and testing developed during the last two censuses, especially at that of 1881 have been very elaborate. Finally a report was written, and various tables and results sent up to the Government of India for the production of an Imperial publication.

686. POPULATION GENERALLY.—The number of towns in the Presidency returned as such according to the latest census is 227. The table at foot [2] gives the population of the ten chief towns, excluding Madras City. The total number of towns and villages combined is 52,648. This relates exclusively to inhabited towns and villages, and is therefore not identical with the number of villages returned in the revenue accounts. In the latter the term village is often applied to what is merely a revenue unit of area. The table below shows the number of inhabited villages returned in the census.[3] Excluding the talooks of Bhadrachellam and Rekapully in the Godavery district, the total number of houses returned is 6,422,079, of which 717,521, or 11·17 per cent., are unoccupied. The total population of the Presidency (including the Native State of Poodoocottah) is returned at 31,170,631, of whom 15,421,043 are males, and 15,749,588 are females, the latter being to the former in the proportion of 505 to 495. 3,027,058, or 10 per cent., is the town population; 28,143,573, or 90 per cent., is the rural population. The proportion of so-called urban population is highest in Tinnevely (20·1 per cent.), where many large agricultural villages have been returned as towns. The proportion is lowest in South Canara (4·1 per cent.) and in Kurnool (5·1). The total area is 141,001 square miles, and the total population, as just mentioned, 31,170,631. This gives on the whole area 221 persons to the square mile. In 1871 the density was found to be 226·2 per square mile. The proportions for other provinces of India are shown below. The average density in the principal European countries is also given below.[4] Madras therefore, standing third of the Indian provinces, has a greater density than any European country except Belgium, England and Wales, Holland and Italy. In the talooks of Combaconam, Mayavaram, Negapatam, Nunniam and Shiyally in Tanjore district, on an area of 1,323 square miles there is a population of 1,160,827, or 877 per square mile. This is in the centre of the Cauvery irrigation delta, and is the richest (as well as the most populous) tract in the Presidency. In Vizagapatam the talooks of Palcondah, Parvatipore, Sautore and Srungavarapocote contain on an area of 422 square miles a population of 518,722, or 1,229 per square mile. The talook of Ponnany in Malabar has an area of 390 square miles, a density of 1,007 persons to the square mile. A map showing by diagram the relative density of the population in the different revenue districts[5] is excluded here by necessities of publication, but will be found in the collection of maps given with Vol. III. Omitting Madras City, the Agency Tracts, and the Native States, there are 709 persons per square mile of cultivated land and 388 per square mile of culturable (that is to say cultivated and not yet cultivated). In Tanjore the figures are 1,085 and 770. There was in Madras in 1881 an area of

2·9 acres to each person; against 1·64 acres in England in 1871. There were again nine-tenths of an acre actually cultivated for each person living; besides seven-tenths of an acre for each person which were capable of cultivation, but were not at that time cultivated. That is to say, there were 22,000,000 acres (or 0·7 per head) which either had not yet been brought under the plough or had been left fallow. For the whole Presidency the average number of inhabitants to an occupied house is 5·5; in towns 5·8, in villages 5·4. In 1871 the general average per house was shown as 5·01, but this was calculated on all houses; the true proportion per inhabited house was 5·33. The increase per house in 1881 is probably only apparent. It may be fully accounted for by the fuller returns of females. The averages per house in other Indian provinces and in the United Kingdom are given below.^[6] The so-called floating population, i.e., those who did not sleep in any house on the night of the census, amounted to nearly 2 per cent. of the whole population:

687. RELIGION, SECT AND CASTE.—The table at foot gives the classification and the numbers of the Madras Presidency population under each creed.^[7] There are only three religions with any considerable number of followers in the Presidency, viz., Hindoos, Mahomedans, and Christians; the proportion per 1,000 of the population being 914 Hindoos, 62 Mahomedans, 23 Christians, and 1 “others.” Mahomedans and Christians are proportionally much more numerous in towns than are Hindoos. Among Christians the excess of women is higher than among the followers of any other religion. The statement at foot shows the distribution of Hindoo sects.^[8] The Hindoo population is returned under 257 sub-heads of caste, which are grouped under 18 major heads in the table at foot.^[9] There were in all 19,044 different castes named. It must be remembered that only a very limited number of these caste names are employed as third-names in the personal appellations of Hindoos; for which see Vol. II, App. XXXIV. Excluding Bhadrachellam and Rekapully in the Godavery district, there are 1,932,910 Mahomedans in the Presidency. They may be held to comprise distributed the religious sects mentioned

below.^[10] Malabar contains more than the average proportion of Shiabs. The largest number of Wahaubies in any district is 134 in North Arcot, and the sect has lost 74·2 per cent. since 1871. More than half the Farasies are in Nellore. There are three race divisions of Mussalmans in this Presidency; first the northern or immigrant Mussalmans; secondly the Moplah; and thirdly the Lubbay. The first are Moghuls, Pathauns, Arabs, Sheikhs and Syeds, who are the descendants of the northern invaders. These are most numerous in the northern districts, in Kurnool, Cuddapah, and Bellary, and in Kistna. The Moplahs and Lubbays are for the most part of pure Dravidian descent. The Moplahs are almost exclusively found in Malabar and South Canara. The Lubbays are chiefly found in Tanjore and Madura. The numbers according to this division are roughly:—Northern Mahomedans including Syeds, Sheikhs, Moghuls, Pathauns and Arabs, 695,235; Lubbays, 515,440; Moplahs, 722,896; total 1,933,571. The first of the foregoing classes might be divided in the following estimated proportions:—Sheikh, 55·63; Syed, 23·67; Pathaun, 15·55; Arab, 3·80; Moghul, 1·25; total 100. A very large proportion of the Mussalmans in nearly every district is found in the towns. The return of Christians of all denominations is 710,802. Of the total (711,072), 473,353 are Roman Catholics, and distributing the “not stated” total proportionately, the Roman Catholics represent 68·68 per cent. of the total population. The following are the most conspicuous groups of the Christians, with their numbers roughly estimated:—Europeans and Eurasians, 32,000; Goa Roman Catholics of the west coast, 100,000; Mission Roman Catholics of the south, 300,000; Anglican converts of the south, 100,000; Lutheran converts of the west coast, 8,000; Baptists of Nellore and Kistna, 30,000. The proportion of Christians in the population is very striking when compared with other provinces as the figures in the statement at foot show.^[11] Both in actual numbers and in proportion to the general population

Bengal	128,135	18	Berar	1,336	6
Punjaub	33,609	16			

Madras stands in this respect at the head of the list of provinces; and if the southernmost part of the Presidency be taken, it is found that in a compact tract containing 7,213,843 souls, 365,544, or 5,067 per 100,000 are Christians. The Church of England in the south and the Baptists in Nellore and Kistna have made great advances of late years. But the Roman Missions, founded three and-a-half centuries ago, have still the largest hold on the country, and their activity is as continuous as it is widespread. Roman Catholics represent $25\frac{1}{4}$ per cent. of the Europeans, $37\frac{3}{4}$ per cent. of the Eurasians, and (including the "not stated" distributed) 68.68 per cent. of the total Christian population. There are 24,962 Jains. These are found chiefly in the districts of South Canara and the two Arcots. Of Booddhists there are only 1,546. Of these, 875 are males and 671 females, a proportion of 566 males to 434 females. The Jews occur only in Malabar. There are only 30 (17 males and 13 females). The Brahmos and Theists together make 145.

688. RELATIONS OF THE SEXES.—The proportion of the sexes varies in the different creeds and races as the table at foot illustrates.^[12] The proportion of sexes as observed in the several Indian provinces and in England and Wales is given below.^[13] Exclusive of the Hill tracts and distributing 46,984 "not stated," there were, in round numbers, 13,740,000 single, or about $45\frac{1}{2}$ per cent.; 12,650,000 married, or about 42 per cent.; 3,820,000 widowed, or about $12\frac{1}{2}$ per cent. The table at foot gives this in detail for males and females.^[14] There are several striking facts revealed by this table. Considerably more than half of the male population is unmarried, while little more than one-third of the female population is unmarried. There are nearly six widows to every widower, and there are nearly three hundred thousand more wives than husbands. The statement below shows how these relations stand elsewhere in the Empire.^[15] From this it will be seen that, omitting the small provinces of Coorg and Assam, the proportion of unmarried of both sexes is higher in Madras than anywhere else in India. The proportion of married of both sexes is much lower than anywhere in India. The proportion of widowers is below the average, that of widows is so high as to be

[14] PROPORTIONS OF SINGLE, MARRIED, AND WIDOWED.

	Single.		Married.		Widowed.		Total.	
	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.
Numbers	8,167,888	5,572,711	6,187,841	6,466,758	572,095	3,251,463	14,927,824	15,290,932
Percentage	54.73	36.45	41.45	42.29	3.83	21.26	100	100

equalled only in Bengal, and the disproportion between widowers and widows is more marked than anywhere except in Bengal. In Madras, excluding the Agency Tracts, 101,679, or 173 in 10,000 of the men under 15 were married. In England only 11 in 10,000 of the men under 20 were married. Above the age of 15 in India the mass of the husbands may be regarded as corresponding to the mass of husbands in England as potential fathers of families. Under 15 there are 652,423 wives in Madras, or 1,132 in 10,000. In England under 20 there are only 67 in 10,000. Over 15 only 5·3 per cent. of the females are unmarried, while in England up to 20, 25·8 women are unmarried. But there are proportionately $2\frac{1}{2}$ times as many widows over 15 in Madras as there are over 20 in England, and there are practically no widows (3 in 10,000) under 20 in England. There are 81,043 Hindoo widows under the age of 20, three-fourths of whom are among the Brahmins. In every district there are more wives than husbands, but the excess is so slight as to support the belief that polygamy, although allowed to Hindoos and Mussalmans by their laws, is rejected in practice.

689. AGE.—The numbers of males and females and of the total population at the different ages are given in the statement at foot.^[15]

690. OCCUPATION.—There were 459 heads of “occupations of the people” in the last census. These are grouped in eighteen orders and again more broadly under six main classes, viz. :—Professional, Domestic, Commercial, Agricultural, Industrial, and Indefinite and non-productive. The last class includes the great proportion of females and juveniles, and 46 per cent. of the total population is shown under this head as of “no occupation.” Of the remainder, which represents the workers, male and female; 65·2 per cent. are agricultural, 20·1 per cent. are industrial, 8·0 per cent. are labourers, 1·4 per cent. are of the learned professions. Under the heads Government Service (Civil and Military) “Commerce” and “Domestic,” there is altogether only 5·3 per cent. of the total working population; 3 per cent. of the agricultural population have returned themselves as following other occupations in addition to that of agriculture. The table below shows the

proportion of the sexes in each of the classes and orders.^[17] It will be noted that the occupations on which the females are most largely employed are at once the hardest and least skilful. Agricultural labour and indefinite unskilled labour include 2,845,387, or considerably more than two-fifths of the working women, while they include only 1,739,112, or less than one-fifth of the working men. The proportion of persons employed in each class in Madras in 1881 and in England in 1871 are shown in the table at foot.^[18]

691. EDUCATION.—Of the 31 millions of total population nearly $2\frac{1}{2}$ millions are returned by the census as more or less educated or under instruction; 133 out of every 1,000 males and 8 out of every 1,000 females. For a rough division, the age from 5 to 15 represents sufficiently closely the period of scholarship. Of male children up to 15 there are returned as—under instruction, 464,046; educated, 76,211: total 540,257; add estimated omission, 23,580; grand total, 563,837; or 14 per cent. of the male children between 5 and 15. Above 15 there are shown

including the "not stated"—males under instruction, 55,777; educated, 1,459,579; total, 1,515,356; add estimated omissions, 40,991; grand total 1,556,347; or 17·22 per cent. of the males above 15. Altogether of males, of an age to be educated there are 15·73 per cent. educated. In the last ten years there has been a marked spread of education as shown below.^[19] The male population has improved by about 40 per cent. as to the numbers educated or under instruction. The advance is less marked among Hindoos than among the other creeds. The proportionately high return of education among Native Christians is noticeable. The highest degree of education is found as might be expected, in Madras City, the percentage of educated males being 46·48 there as against 15·73 per cent. for the Presidency. Of the ordinary districts, Tanjore stands first with 26·26 per cent. of its male population above 5 years of age educated. The progress of female education, if not so important, is much more remarkable than the general progress. In 1871, 36,502 females, or 0·29 per cent. of the females above 5 years of age, were returned as educated. In 1881, 176,784, or 1·33 per cent. of the females above 5 years of age, were under instruction or educated. Proportionately to their total numbers, twice as many Mahomedan women and fifteen times as many Christian women are educated as among the Hindoos. The number and proportion of educated females in the different religions are noted in the table at foot.^[20]

692. THE EUROPEAN AND EURASIAN ELEMENT.—The total European population in 1881 (excluding Bhadrachellam and Rekapully) was 10,838, of whom 7,326 were males and 3,512 females. This gives 48 females to every 100 males. In 1871 there were 14,561 Europeans, the proportion being 46 females to every 100 males. This indicates a decrease of 25·57 per cent. on the total European population, chiefly due to military movements. The statement at foot gives the number of Europeans in each district.^[21] 10·57 per cent. of the total European population are Europeans of other than British nationality. Of those born in India, 488 are

males and 512 females, while of those born out of India 775 are males and 222 females. Europeans born in India are of two classes: first those who were sent home in childhood and have returned as adults, and secondly those who have been born and reared in the country. The latter form but a small class. The number of European families domiciled in the plains of India is not numerous. The former class is, in all respects except the accident of birth-place, practically the same as the British-born subject. The total number of British-born Europeans as returned is 5,883. Of these, 4,643 are males and 1,240 females, a ratio of 789 to 211 per thousand. They are shown under "nationality" in the table at foot.^[22] The facts as to conjugal condition for this population are given below.^[23] It appears that there are nearly two bachelors to every married man, and nearly two wives to every spinster; that there are more widowers than widows; that there are $7\frac{1}{2}$ bachelors to every maiden; and that the number of husbands is more than double the number of wives. This last fact represents the proportion of English married women absent in England. A statement of the ages of the British-born is given below.^[24] Of Europeans other than British there are 2,587. Of these, 382 (280 males and 102 females) are French, and 146 (97 males and 49 females) are Germans. The former are chiefly found in the Godavery district, and in Madras city; the latter in Malabar, South Canara, and the Neilgherries. In the Eurasian population the following figures appear: males, 10,969; females, 10,923; total, 21,892. This gives a decrease of nearly $17\frac{1}{4}$ per cent., as against the 1871 census, which cannot altogether be accounted for in the same way as the decrease in Europeans. There is a falling off of 4,558 in numbers or 17.23 per cent., and the proportion of the sexes has been still more markedly disturbed, as, instead of 505 females to 495 males as in 1871, there are only 499 females to 501 males. The table at foot shows the occupation of the British-born males and the proportion in which they are distributed to the different classes of employment.^[25] Among

the British-born 92·91 per cent. of the total male population is occupied; and as 208 or 4·37 per cent. of the male population is under fifteen years of age, the result is that only $2\frac{3}{4}$ per cent. of the adult male Britons are unemployed. Of the total of 309 unoccupied in 1881, 33 were prisoners, 38 were pensioners, and 201 were under fifteen years of age.

EMIGRATION.

693. INTRODUCTION.—An emigrant in the ordinary acceptation of the term is a person who leaves the state or dominion in which he has heretofore lived, and goes for the purpose of permanent residence to some other state or dominion, especially where the latter is distant and presents different conditions of life. In this sense the English emigrate to the United States of America, and to the British colonies in America, South Africa, Australia, and New Zealand. Similarly the South Indian population have during the last century emigrated to such countries as Burmah, the Straits Settlements, Ceylon, and even further abroad to the islands off the east coast of Africa, and the West Indies. Technically the latest Indian Emigration Act excludes Burmah as being part of the Indian Empire, and the Straits Settlements and Ceylon as being quasi-Indian countries, and defines as an Indian emigrant one who goes by sea under contract to labour for hire to some country other than either of those just mentioned. The emigration under this Act is in other terms styled Colonial Emigration. The official definition will be here maintained, but inasmuch as for many purposes the movements of the population whether under contract or otherwise within the Indian Empire and to the Straits and Ceylon partake considerably of the nature of emigration, these will be first mentioned in the present article.

694. MIGRATION TO OTHER DISTRICTS.—Migration for the purpose of labouring for hire in distant districts of the same Presidency obtains in the Madras Presidency to a certain extent, though not largely. It has been ascertained that 95·6 per cent. of the Madras population continue to reside in the same revenue districts where they were born. The comparative table at foot [1] shows that the population is not so stationary in any other part of India. The last column of the next table [2]

shows the proportion of the population who have left their districts to go to distant districts, that is to say to districts other than those immediately adjoining. It will be seen that the total figure is 135,256 or 0·44 per cent. Six decimal seventy-three per cent. of those born in Madras town are living in other districts. In migration to adjoining districts the proportion of males to females is 44 to 56; in migration to more distant districts the proportion is 55 to 45. The theory that there was extensive migration during the Madras famine of 1876-78 does not meet with confirmation so far as the figures of the 1881 census are concerned; if therefore there was migration, there was subsequent early return.

695. MIGRATION TO OTHER PROVINCES.—The table at foot [3] shows the number of persons born in the Madras Presidency who were found in 1881 to have migrated to other provinces, whether by land or sea. Here again it will be seen that the Madras population do not move to any great distance. The emigrants to Bengal are probably all Ooriyas of the Ganjam district, and those to Bombay are probably inhabitants of South Canara who have moved into North Canara. The only migrations which are at all considerable, without however falling within the legal definition of emigration as above-mentioned, are those to Burmah, the Straits Settlements, and Ceylon. For geographical and political accounts of these countries see the article on Relations with Neighbouring States and Provinces in Chapter I.

696. Free migration to Burmah has probably taken place to an appreciable extent for the greater part of a century. At first the employment was confined to that of domestic service and the miscellaneous labour of mercantile ports. Subsequently agriculturists also migrated. At the present day the greater part of those who go to Burmah go to the ports, and return at the end of the shipping season. Women go in numbers for the purposes of prostitution, and stay some years. A temple was recently built at Coringa in the Godavery district at a cost of Rupees 10,000 by a woman of this class who had saved money and returned. From 40,000 to 50,000 Teloo goo coolies go annually to Burmah from Cocanada and other northern ports, and nearly all return as just mentioned. On the occasion of a

visit of the late Lord Mayo to Rangoon, one of the requests made in the memorial of the European commercial community was the introduction of a Labour Contract Law; and in April 1872 the Chief Commissioner of Burmah was asked to prepare the draft of a law that would meet the wants of the province. The Bill framed by the Chief Commissioner became law subsequently, after undergoing modifications. Meanwhile in 1873-74, during the Bengal famine, the question of promoting emigration to Burmah was taken up in Calcutta. In 1874 the Government of India sanctioned the establishment of a system of State emigration (under contract, and not under any special law) from Lower Bengal to British Burmah, and allotted 5 lakhs of rupees for the expenses. It was expected that the flow of emigrants from Bengal would in some small degree benefit the districts which were, when the experiment commenced, affected by the famine; but this anticipation was not fulfilled. Out of a total of about 7,400 emigrants, 5,683 were recruited in Calcutta and its suburbs, while only 1,541 came from famine districts. The system continued in force up to the end of December 1875, when it was determined to close the Calcutta agency and transfer the field of recruitment to this Presidency, where it was believed that labourers better adapted to the requirements of British Burmah could be recruited at less expense. By this time the Bill before spoken of had passed through the Legislative Council, and on 25th January 1876, the British Burmah Labour Act, India No. III of 1876, became law. This was a comprehensive measure, going beyond the provisions of the General Indian Emigration Act, inasmuch as its object was to provide, not only for the recruitment and transport of labour, but also for its regulation in the place of employ. An Emigration Agent and a Medical Inspector were appointed at Cocanada, which was selected as the best port of embarkation. In March 1877, when the Madras famine was at its height, the Chief Commissioner of Burmah hoped to be able to find work for 20,000 persons. An allotment of 19 lakhs was sanctioned by the Madras Government on condition that the emigrants were to be selected from the famine districts. Emigration began in the middle of September 1877 and continued till 31st March 1878, but altogether only 758 emigrants crossed over. The Act failed inasmuch as the natural conditions necessary for such a measure were absent.^[4] Voluntary migration was not deficient, nor were there grounds for interference on the score of deficient protection in the country migrated to. The Act therefore could not forbid the voluntary transit of labour, and the consequence was that the Government took the field as a competitor with private agencies. Moreover the Act imposed too many obligations on the Government, and the system under it was rather one of contract between the labourer and Government, than of contract between the labourer and the employer. The Government in fact undertook to pay the emigrants' wages, whether they found employment or not. The Cocanada agency and the depôt at Rangoon cost Rupees 39,534 during the period for which they were open. The recoveries from the coolies were Rupees 2,086. The balance unrecovered was Rupees 37,448, and roughly speaking, the emigrants cost Government Rupees 50 a head. All operations under the scheme were accordingly stopped, and the Emigration Agent at Cocanada was in 1878 instructed to close his accounts, dispose of the depôt buildings, and dismiss his establishment. The Act itself has been repealed by India Act VII of 1883. With the view of encouraging emigration to British Burmah, the Chief Commissioner of that province has now made arrangements with the British India Steam Navigation and Asiatic Steam

[4] CONDITIONS OF A BURMAH LABOUR LAW.—A labour law may be required under two conditions: (1) when labour cannot be had by voluntary contract, except at great cost and with great difficulty; or (2) when, from local circumstances, special precautions are needed for the protection of immigrants. It has been held that neither of these conditions has existed in Burmah under recent circumstances. The want of Burmah is a settled agricultural population of Burmans or Shans to cultivate the extensive tracts of waste land in the interior. There is little, if any, real difficulty as to labour in the seaport towns. The province is in direct and constant steam communication with the Madras coast, whence labourers cross over to the Burmah rice-ports annually for the busy season, returning home with their savings at its close. The freedom with which these men can come and go at their own pleasure; the high wages they can command as coolies in connection with the milling and shipping of rice; the facilities they have for communicating with their homes while absent; the security from molestation which they enjoy in their intercourse with the Burmese; the easy terms on which they can be conveyed to and from their country; and principally the prospect of a speedy return to it: all these circumstances have militated against the success of any scheme directly controlled by Government. To give such a system a prospect of succeeding, the free labour system should first of all have been prohibited; but this would neither have been advisable nor practicable. The result has been that private employers secured the services of men who came over at their own expense, and made their own terms. Government, on the other hand, imported coolies at great cost, and had to feed and house them; while the coolies themselves deserted, Government being obliged to engage special police to watch them.

Navigation Companies by which these companies agree to carry deck passengers to Rangoon at reduced rates.

697. The earliest emigration to the Straits Settlements was from the south of the Madras Presidency. The emigrants were employed from the first both as domestic servants and as agricultural labourers. When the General Emigration Act, India No. VII of 1871, was passed, the Straits were not excluded from its restrictions, but on urgent representations of the injury to the agricultural industries of that colony, caused by the check in the supply of labourers, an Act No. XIV of 1872 was passed, enabling the Governor-General in Council to make the exemption by notification, and on the 6th June 1872 such a notification was issued. During the next four years there was correspondence regarding Straits emigration, which ended in the passing of an Ordinance, No. I of 1876, by the Straits Government, and of India Act No. V of 1877, specially regulating Straits emigration. By the ordinance, the Straits Government keep the Indian coolies under observation during the whole of the period of their contract. The cooly and his destination are registered, and the estates employing Indian coolies are inspected and regulated by the Government. The Straits Government undertakes to re-convey to India all coolies who become incapacitated for labour. India Act V of 1877 applies to this Presidency only. The only lawful ports of emigration are those notified by the Madras Government; and at present there are two such ports, Negapatam and the French port of Caricaul. The Head Assistant Collector acts as Protector at the former and the British Consular Agent at the latter port. Perak, on the mainland of the Malay peninsula, but not included in the Straits Settlements, tendered in 1878 for South Indian coolies, but as this arrangement would have fallen under the General Emigration Act and coolies would have had to embark therefore from Madras and not from Negapatam, the plan was abandoned.

698. It is probable that from the date of its European colonization the island of Ceylon attracted labour from the South of India. The migration now is on a larger scale than that to Burmah or the Straits, the greater part of the labour required on the coffee estates in the island being furnished from Southern India. At certain seasons of the year, when labour is in demand, the labouring classes of the southern districts travel across to Ceylon; and, when they have saved a little money, return again to their native villages. The cooly traffic between the south ports and Ceylon is constant and mutually advantageous to the people of India and to Ceylon. The high wages offered by the planters enable the people to save, and ultimately to take the position of small farmers in their own villages, while the planters in Ceylon can always obtain as much labour as they want by offering sufficient inducements. The Ceylon Government undertakes to see that the coolies are properly housed, fed, and provided with medical attendance, and the migration to and from the coffee districts is entirely voluntary. About 70,000 persons go over to Ceylon every year from the southern districts, and of these it is estimated that about 54,000 return to India. The others settle more or less permanently in the island. The table at foot shows the migration of the Madras population to Ceylon for the last twenty-two years as noted or estimated by Government officers. The real numbers are probably higher.^[5] The greater part of the Ceylon coolies

are probably doing better for themselves in the land of their adoption than they could hope to do in their native land. They are free to return whenever they please, and that they do not come back must be taken as an indication that they are content to remain. The emigration to Ceylon is specially excepted from the operation of the Colonial Emigration law by one of the sections of the Act. Free emigration of labourers, which prevailed throughout the territories of the East India Company, was originally extended to Ceylon by India Act XIII of 1847, on the ground that that dependency was geographically, historically and socially considered analogous to the continent of India. Further there was sufficient testimony to the general good treatment of the coolies in Ceylon. In 1873 when the question was again raised, it was decided to continue existing arrangements. All that is done by Government is to endeavour to check the statistics of emigration from the southern districts through the Collectors' offices. The Customs Superintendents at the ports whence emigrants usually embark take note of their numbers, and hence it is believed that a tolerably accurate account is taken of their movements. The emigration is regulated, as far as the Ceylon Government is concerned, by the Ceylon Ordinance No. XI of 1865.

699. COLONIAL EMIGRATION.—As already indicated, there is room for a labour law, either in the interests of the employer where labour is hard to obtain, or in the interests of the employed when the relative strength of the parties to the contract is such that the Legislature must intervene to protect the weaker one. It is where one or both of these two conditions exist that the Government is concerned with emigration. The principal Indian legislative enactment on this subject is that which deals with colonial emigration, or emigration to countries beyond Indian waters.^[6] The existing law is contained in the Indian Emigration Act, No. VII of 1871, and the rules thereunder for emigration from the ports of Calcutta, Madras, and Bombay, together with the Convention with France of 1861 and that with Holland of 1870. There is no Convention with Denmark. An amending Act, India No. XXI of 1883, has been passed, which will be the future Emigration Act for the colonies, and its application is imminent. The general system of colonial emigration may be thus described. Colonial Governments appoint persons of approved character to conduct emigration on their behalf from the Presidency towns of India. These agents employ recruiters, of whose respectability they are required to convince the Government Protector of Emigrants. The recruiters persuade persons to emigrate, and take them before the magistrates, who register the engagement. The recruits are then conveyed to Calcutta, Madras or Bombay, where they are housed under the immediate eye of the Emigration Agent in depôts which have been licensed as fit places for the collection of emigrants by the Protector. They are thence shipped on board vessels, which are also licensed, care being taken that they are equipped in every respect with what is needed to ensure the safety of the passengers on their long voyage; and there the direct concern of Government with the transaction ends. On obtaining information however that coolies are not properly cared for in the colonies, or that infectious disease prevails there, the Supreme and Local Governments have power to stop emigration and render it illegal.

700. Colonial emigration is lawful under different provisions of law to the British Colonies of Mauritius, Natal, British Guiana, Jamaica, Trinidad, the Windward and Leeward Isles, and the Feejee Isles; to the French Colonies of Réunion, Guadeloupe, Martinique, and French Guiana; and to the Danish Colony of St.

[6] CLASSIFICATION OF BRITISH COLONIES.—British colonies are divided into three classes. First, the Crown colonies, in which the Crown has the entire control of legislation, while the administration is carried on by public officers under the control of the Home Government; secondly, colonies possessing representative institutions, in which the Crown has no more than a veto on legislation, but the Home Government retains the control of public officers; and thirdly, colonies possessing responsible Governments, in which the Crown has only a veto on legislation, and the Home Government has no control over any public officer except its own representative. Of the British colonies with which Indian Governments are concerned, Demerara, Jamaica, Mauritius, the Straits Settlements and Feejee are Crown colonies; and the Leeward Islands, the Windward Islands, Natal and Ceylon possess representative institutions. There is no Indian emigration to any colony with a responsible Government; but the possibility of emigration to the Cape and to South Australia, both of which belong to the third of the classes enumerated, has been discussed. Emigration to Queensland, which also has a responsible Government, was sanctioned some years ago, but none has taken place.

Croix.[7] Under Section 24 of the 1871 Emigration Act, the Governor-General has power to extend emigration to places not already specified in that Act.

701. Emigration for the British colonies named above is provided for under India Act VII of 1871. In this case each Colonial Government concerned nomi-

[7] **SKETCH ACCOUNT OF DIFFERENT COLONIES, BRITISH AND FOREIGN.**—(1) *Mauritius*. The islands of Mauritius and Réunion lie east of Madagascar. Both of these colonies were first regularly settled by the French, and both in the early years of this century fell into British hands. Mauritius has been a British possession since 1810. In both of these colonies slavery existed; it was abolished in Mauritius in 1834 and in Réunion in 1848. The abolition of slavery in British colonies in 1834 undoubtedly gave the first great impetus to Indian emigration. There are more Indian coolies in the Mauritius colony than in any other; the number on the 31st December 1877 being 141,309, or more than a third of the total population of the island, which in 1871 stood at 316,042. This is the only British colony from which emigrants get no return passages. Return passages were abolished in 1853, for emigrants thereafter embarking. (2) *Natal*. This colony is on the south-east coast of Africa. Its area is 18,750 square miles, and its total population, according to the census of 1877, 325,512. It is the only colony not in the tropics to which Indian emigrate. Except in a narrow belt, 15 miles in breadth, which lies between the first step of the interior tableland and the coast, and is cultivated with sub-tropical staples, such as sugarcane and coffee, its industries are not such as have hitherto been found suitable for the Indian labourer; they are rather those of the European colonist of Australia—horse and cattle breeding, sheep-farming, and the cultivation of the hardier cereals. British occupation dates from 1813. Notwithstanding the character of the colony, the number of Indian labourer there employed is considerable. The number of total Indian emigrants on 31st December 1882 was 24,459. (3) *Guiana*. Guiana, in the largest acceptance of the term, lies on the north-east shoulder of the South American Continent, between the Orinoco and the Amazon. This vast territory, with an estimated area of 700,000 square miles, is divided into Brazilian (formerly Portuguese) Guiana, Venezuelan (formerly Spanish) Guiana, and Colonial Guiana. The two former, comprising about five-sixths of the entire region, are now included within the limits of their several countries; whilst Colonial Guiana is that to which the general term of Guiana is now only applied. It is sub-divided into British, Dutch, and French Guiana, otherwise respectively known as Demerara, Surinam, and Cayenne. British Guiana, the most westerly of the three colonies, has an area of 76,000 square miles, and a population of 193,491. The first settlement was formed by the Dutch in 1580 on the rivers Pomeroon and Essequibo. The English began to establish themselves about 1630 in the neighbourhood of the rivers Berbice and Surinam. Most of British Guiana, however, remained in the hands of the Dutch till 1796, when it was surrendered to the English. It was restored to the Dutch in 1802, and was again taken by the English on the outbreak of war in 1803, and has since remained in their possession. Surinam, with an area of 59,061 square miles, and a population of 69,329, lies between British and French Guiana. Throughout the whole, or very nearly the whole, breadth of British Guiana a wide swamp district lower itself than the average sea-level, and in consequence very difficult, if not impossible, to drain, cuts off the available landstrip of the coast itself from the firm but distant highlands of the interior, and by so doing confines the choicest sugar-producing tracts of the colony to the immediate vicinity of the shore, where they are all arranged side by side in a long narrow belt, edged by the ocean to the north and the almost equally unmanageable morasses on the south. In Dutch Guiana, on the contrary, a rise, slight but sufficient, of the continental level has thrust forward the swamp region from the interior down to the very shore, where it forms a barrier behind which the sugar lands and estates ensconce themselves, with no background so long as the Brazilian frontier remains undefined. Paramaribo, the capital, is described as a Batavian Venice in the equatorial tropics, in a land where it always seems afternoon. French Guiana, the smallest and least salubrious of the three colonies, occupies the outer curve of the northern coast, its form being that of a broken triangle. The area is 56,783 square miles, and the total population only 24,432. The sea margin extending over 200 miles is the inhabited part, and this has been partially cleared for the cultivation of sugarcane and other staples; but there is no open arable country throughout the colony. It is all dense forest and swamps which, during the hot season, here and there partially dry up. From the sea the country appears low and flat, except for a few hills sparsely scattered about. A jungle of mangrove, beginning on the sandy shore, forms an impenetrable rampart along the whole coast, which is intersected by a net-work of rivers and creeks in every direction. The planters, where the greater proportion of the Indian coolies have been employed in the deadly trade of gold-washing, are established many miles up the principal rivers and their branches, and can only be reached by boats, no roads, or even tracks, running to any distance in the interior. In 1874 there were serious riots among the emigrants in British Guiana, owing to reduction of wages consequent on the state of the sugar market. It is stated that there is a great scarcity of women in this colony. (4) *Jamaica*. The Island of Jamaica, with the Turks Islands, has an area of 6,900 square miles, and a population in 1871 of 610,354. Its configuration is that of a central mass of mountains, rising in places to heights of 7,000 or 8,000 feet, and surrounded by a low-lying margin. There have been complaints that the colony is decaying or decayed; but these the Colonial Government regards as unfounded. Total Indian emigrant population on 1st October 1883 was 13,245. (5) *Trinidad*. The Island of Trinidad was first colonized by the Spaniards in 1588. In 1676 the French held it for a short time, but it was speedily restored to Spain; and in 1797 it was taken by the British, who have retained possession of it ever since. The area is 1,755 square miles, and the total population in 1871 was 109,638. The island is well watered, and the soil generally fertile, but there is much mountainous and broken ground. The coolies in Trinidad are singularly well off. One noticeable feature in the colony is the success which has attended the system of granting lands to immigrants in commutation for the back-passages. (6) *Windward and Leeward Islands*. The Windward and Leeward Islands belong to the group of the Lesser Antilles which forms the south-eastern end of the insular chain which, stretching from the mouth of the Gulf of Mexico to the eastern point of the South American Continent, divides the Caribbean Sea from the Atlantic Ocean. Those of the Windward Islands which are now British are Barbados, Grenada, St. Vincent, Tobago and St. Lucia. Their total area is 775 square miles, and their population 284,078. The Indian Governments are concerned only with Grenada, St. Lucia and St. Vincent. Grenada has an area of 133 square miles and a population (inclusive of that of the Grenadines) of 37,684. It was ceded to Great Britain in 1783 by the Treaty of Versailles. The area of St. Lucia is about 250 square miles and its population 31,610. It abounds in mountainous ridges, valleys with flat, rich bottom-lands, and streams of considerable length and volume. Many of the valleys are very little higher than the level of the sea, and the natural drainage is imperfect. St. Vincent has an area of 131 square miles and a population of 35,688. The Leeward Islands, under British authority, comprise Antigua, Montserrat, St. Kitts, Nevis, Dominica and the Virgin Islands. At present the only islands which take coolies are St. Kitts and Nevis. St. Kitts is of volcanic formation. Its area is 68 square miles, of which, at the time of Mr. Geoghegan's Note, half was said to be cultivated mainly with sugarcane. The population in 1871 was 28,169. Nevis is a single mountain rising to 3,203 feet above the sea, and its area is calculated at 45 square miles. In 1871 it possessed a population of 12,074. Sugar is the chief product. Emigration to St. Kitts was first legalized by an Act of 1860. An application for its extension to Nevis was made in 1871. After some hesitation, and two calls for further information, a notification, No. 92, dated the 11th April 1873, declared the emigration of natives of India lawful to that island. The only other of the Leeward Islands needing remarks is Antigua, the most important of the Federation, and the residence of the Governor-in-Chief. It has an area of 108 square miles, of which about six-sevenths are under cultivation. (7) *Feejee Islands*. The colony of Feejee was ceded to the British Government in the latter part of 1874. It comprises more than one hundred islands lying between 15° and 19° south latitude. The area is 7,403 square miles and the population 142,000. The climate is exceedingly healthy for a colony within the Tropics. (8) *Réunion*. The island of Réunion, or Bourbon as it was formerly called, lies 400 miles to the east of Madagascar. It is 38 miles long and 28 broad with an area of about 1,579 square miles. It is entirely of volcanic formation, and one of the two mountains of which it consists is still an active volcano. It has a

nates, as above said, its agent and recruiters for the Presidency, and establishes its depôt for the reception of emigrants at the town of Madras; the Protector of Emigrants, assisted by a Medical Inspector, represents the local Government. The emigrant enters into an engagement with the recruiter in one or other of the districts for service in the colonies under certain conditions as to time of service, pay, rations, hours and days of work in the colony, and with free passage both to and from the colony. The only British colonies at present represented in practice in the Presidency are the Mauritius and Natal. The Mauritius, from which emigrants are not allowed free return passages, is an exception to the arrangement last mentioned. The time of service is usually five years. In the case of the Mauritius the monthly pay ranges from 5 to 7 rupees for an ordinary cooly, and from $5\frac{1}{2}$ to $7\frac{1}{2}$ rupees for return coolies emigrating a second time; the advance in pay is gained by progressive service in the colony. In Natal coolies are paid for the first year 10 shillings, for the second year 11 shillings, for the third year 12 shillings, for the fourth year 13 shillings, and for the fifth year 14 shillings. In other colonies the pay is usually 5 rupees. These rates apply only to workmen in the plantations; artisans and skilled workmen are paid according to qualifications. Female emigrants to the Mauritius generally proceed without engagement, their daily hire in the island being 4 annas per diem. In the rare case of an engagement Rupees 2 is promised for the first year only with rations. Female emigrants to Natal receive Rupees 3 per mensem in their first year with annual increments of six pence per annum till fifth year which salary amounts to Rupees 4-3-2. The emigrants have generally to work six days in the week, and nine hours in the day. Emigrants when recruited by the recruiter are registered in the mofussil by Magistrates, and at the Presidency Town by the Protector. The recruit is brought before the Magistrate or Protector as the case may be, and if he is found to understand the terms of the engagement, and to be willing to emigrate, he is registered and sent to the depôt belonging to the colony concerned, where he remains under the care and responsibility of the Colonial Agent and recruiter respectively till he embarks. The Protector of Emigrants and Medical Inspector of Emigrants inspect the depôts from time to time and see that the emigrants are well treated there. Previous to embarkation the vessel intended to carry emigrants is surveyed by competent Marine officers and certified to be fit to carry emigrants, and the Protector personally superintends embarkation. The stock of provisions and medicines, and the accommodation to be afforded, is prescribed by standing orders. The Protector is empowered to stop the embarkation of such emigrants as seem to him unfit to undertake the voyage. When emigrants return, the Protector inquires into the treatment experienced by them in the colony and during the voyage back; and a report is made to Government. Anything worthy of notice and requiring remedy is communicated to the Colonial Government concerned. The return emigrants from the British colonies can only land at the port of Madras, and their numbers are there registered. In 1883-84 the total expenditure incurred by the Natal Agency was Rupees 51,196-15-1, and by the Mauritius Agency Rupees 82,046-4-1.

702. For the French colonies mentioned above, in which case a special convention secures to the French Government similar advantages to those enjoyed

population of 180,000, of whom about 2,000 are French. The average number of Indian coolies from 1871 to 1876 was 45,000. The French first settled here in 1665 and in 1819 it was taken by the British. It was restored to France in 1814 and has belonged to that power ever since. Slavery was abolished in Réunion in 1848. St. Denis, the capital of the island, is on the north coast. Cultivation is restricted to the coasts of the island, the mountainous region in the interior being without inhabitants. Sugarcane is the chief object of cultivation. Cloves, coffee, pepper, and tobacco are also cultivated. The emigration of British Indian coolies to Réunion has been suspended since 1882. (9) *Guadeloupe*. Guadeloupe is one of the groups of the Carribean Islands. Slavery was abolished in 1848. The area is 1,028 square miles, and the population 151,594. The number of Indian emigrants in the island in 1876 was 13,543. (10) *Martinique*. The Island of Martinique lies to the south of Guadeloupe, the British island of Dominica intervening. The area is 617 square miles. The total population is 139,109. Judging from statistics of 1872, there are probably at this date about 10,000 Indian immigrants in the island. Martinique was colonized by the French in 1635. It was taken by the English in 1762, and again in 1794 and 1809, and was finally given up to the French in 1814. (11) *French Guiana*. This French colony has been noticed above. (12) *St. Croix*. The island of St. Croix in the West Indies is 74 square miles in extent, and has a population of 22,760. It was purchased by the Dutch West India Company from the French in 1733, and resold by the Company to the Crown of Denmark. In 1868 coolie immigration commenced by the arrival of 312 immigrants. In August 1873 all the then remaining immigrants elected to stay in the colony on receipt of bounty. The number actually left there in November 1874 appears to have been 87. The cost of importing the coolies in 1868, and of the back-passage for those who returned in 1868, was found to be so great that the colonists abandoned this mode of labour-supply and placed their dependence solely on the neighbouring islands.

by British colonies, the procedure is very much the same as for the British colonies. There are however two ports of embarkation; and two depôts, one at Pondicherry, and the other at Caricaul. The interests of the English Government are represented at Madras, where emigrants are only registered but whence they do not embark, by the Protector of Emigrants, and at the two French ports by two special officers styled British Consular Agents. India Act VII of 1871 applies to French colonies. Return emigrants from the French colonies land at Pondicherry, and are inspected there by the British Consular Agent. Emigration to Bourbon or Réunion ceased in 1882, the Indian Government being of opinion that there had been ill-usage of coolies. Emigration to French Guiana was also stopped in 1876, the climate and the gold-washing industry being both considered seriously prejudicial to the coolies' health. There thus remain at present only Guadeloupe and Martinique.

703. For the Danish colony of St. Croix no departmental provision has been made. India Act VII of 1871 applies to this colony.

704. LAW.—The collective law relating to emigration and still in force is contained in Madras Act V of 1866, an Act to regulate the manner of engaging and contracting with native inhabitants within any of the districts subject to the Government of Fort St. George, for labour to be performed in any part of India beyond the territorial limits of the Presidency of Madras; in India Act VII of 1871, an Act to consolidate the laws relating to the emigration out of India of native labourers; and in India Act V of 1877, a special Act to regulate the emigration of native labourers from the Presidency of Fort St. George to the Straits Settlements. India Act XXI of 1883, an Act to amend the law relating to the emigration of natives of India, will as soon as it is brought into force repeal India Act VII of 1871. The rules having the force of law are contained in foot-note [*] below.

705. GENERAL STATISTICS.—The subjoined abstract [*] shows the number of total emigrants and immigrants during the last eleven years, including Ceylon and the coast on the other side of the Bay of Bengal. The several countries to which the emigrants proceeded, with details of their numbers, are shown in the next statement.^[10] Of the total number of emigrants in 1883-84, 62·9 per cent. went to Ceylon, 22·5 per cent. to British Burmah, 4·1 per cent. to Mauritius and Bourbon, 3·2 per cent. to the Straits Settlements, 2·7 per cent. to Natal, 1·6 to the West Indies and 1·4 to Guadeloupe. The whole of the emigrants to Ceylon went, as usual, from Madura (15,820), Tinnevely (18,705), and Trichinopoly (1,767), while those to British Burmah were exclusively from Ganjam (7,554) and Vizagapatam (5,105).

[*] EMIGRATION RULES HAVING THE FORCE OF LAW:—Under India Act VII of 1871, section 56, the following have the force of law:—(a) Rules—Public Notification, Fort St. George Gazette Supplement, dated 6th October 1874. (b) Amendment of these Rules—Government of India Notification, published in the Fort St. George Gazette of the 19th January 1876, prescribing Taylor's Sailing Directory for the use of emigrant ships; Government of India Notification in the Fort St. George Gazette of the 27th July 1876, which relaxes the stringency of Rule 34 regarding the proportion of adult females, more than 40 per cent. of whom may now be embarked; Government of India Notifications in the Fort St. George Gazettes of the 25th January 1876 and 25th July 1876, prescribing certain pilotage works for the use of emigrant ships to the West Indies; Government of India notifications in the Fort St. George Gazettes of the 12th December 1876 and 23rd January 1877, containing regulations regarding the use of fire and smoking in the 'tween decks, &c.; Government of India Notification in the Fort St. George Gazette of the 16th October 1877 regulating the reception and despatch home of such emigrants as may be entitled to a return passage; and Government of India Notification in the Fort St. George Gazette of the 18th May 1880, which provides for the ventilation of 'tween decks and hold.

MEDICAL RELIEF.

706. INTRODUCTION.—Operations under this section consist of the operations undertaken by Government, or by Municipal and Local Boards in towns and rural circles acting under the orders of Government, for the medical relief of the population. This is done in the case of the Army by Military Hospitals attended by officers of the two Medical Departments (British Medical and Indian Medical);^[1] and in the case of the general public by a system of civil hospitals, dispensaries, and asylums under the control of the Indian Medical Department. Officers of Government are medically attended by officers of the latter department. The general information and statistics regarding public health given in the yearly administration report of the Government are mainly those compiled by the Sanitary Commissioner from the mortality returns. Under the present head is given in that report merely the special information derived from the observation of patients treated in civil hospitals, dispensaries, and asylums.

707. PREVALENT DISEASES OF THE PRESIDENCY.—The most prevalent diseases are fevers, diarrhoea, dysentery, and other bowel-complaints, cholera, and small-pox. The cold season is that which is most fatal to natives. As a rule, mortality begins to decline with the setting in of the hot and dry season, rises again with the moisture of the south-west monsoon, and reaches its maximum in the cold-weather months of November, December, and January. The clothing of natives in general, and of the poor in particular, is insufficient protection against the wet and cold of the monsoon months. The labouring classes have frequently to toil for their livelihood in wet clothes, besides sleeping on flooring rendered damp by the weather. Congestions follow from these causes and account for the heavier mortality during the months specified.

708. LAW.—The law concerning Government Medical officers in the Presidency arranged under subject heads for reference is shown under the title "Medical

[1] SKETCH HISTORY OF THE TWO MEDICAL DEPARTMENTS.—The Indian Medical Department was organized on a regular basis in 1786. It consisted of an establishment of Surgeons and Assistant Surgeons, and was administered by a Board consisting of a Physician-General, a Surgeon-General and an Inspector of Hospitals, with a Secretary. The senior Surgeons of the establishment were also employed in administrative duties in connection with the several divisions of the Army. In 1857 the Medical Board was abolished, and the department was then administered by a Director-General, an Inspector-General and ten Superintending Surgeons. Changes in the title and numbers of the administrative officers have from time to time been made since then. Up to 1880 the medical services connected with European and Native troops were conducted by two distinct departments, the former being administered by the Army Medical Department, and the latter by the Indian Medical Department, in addition to all the medical duties in connection with the Civil department. On the 1st April 1880, the whole of the military medical duties connected with both British and Native troops were placed under one administrative officer, whose official designation is Surgeon-General, Her Majesty's Forces. The amalgamation does not practically extend beyond administrative work, as the executive medical duties connected with European troops are still entrusted to medical officers of the Army Medical Department, and those pertaining to Native troops to officers of the Indian Medical Department. Prior to the reorganization in 1880, the staff of medical officers of the British service in this Presidency numbered 78, but at present its sanctioned strength is 53, including all grades. This reduction has been caused chiefly by the adoption of station hospitals instead of a separate hospital for each regiment or division of artillery, which has reduced the number of hospitals maintained for European troops. Each medical officer of the Army Medical Department comes to India for a tour of 5 years' service, but in special cases this term may, as regards executive officers, be prolonged beyond that period. Forty-nine medical officers of the several grades of the Indian Service are employed in connection with troops as compared with 66 before the reorganization in 1880. The decrease has been caused chiefly by the reduction of administrative appointments and of the number of native regiments.

Relief " in Appendix LIV, Vol. II. Under India Act XXXVI of 1858, Section 2 (Lunatic Asylums Act), rules having the force of law for the superintendence and management of the asylums have been published in the Fort St. George Gazettes of 17th March and 12th June 1868.

709. CONSTITUTION OF THE DEPARTMENT OF SURGEON-GENERAL, H.M.'S FORCES.—The administrative portion of the department consists of 1 Surgeon-General, who may belong either to the Army Medical Department or Indian Medical Service, and 2 Deputy Surgeons-General of the Army Medical Department, and 4 Deputy Surgeons-General and one Secretary and Statistical Officer to the Surgeon-General, belonging to the Indian Service. The executive establishment embraces 50 medical officers of the Army Medical Department and 44 of the Indian; while, in addition to these, all unemployed officers belonging to the latter remain under the orders of the Surgeon-General, H.M.'s Forces. The sanctioned subordinate medical establishment for the hospital service of British troops and certain Indian appointments at present consists of 117 warrant officers, and for Native troops of 126 hospital assistants. The warrant class of the subordinate medical department has this year been reorganized. The total strength will in future be 86, consisting of 8 senior Apothecaries, 24 Apothecaries, 41 Assistant Apothecaries, and 13 Sub-Assistant Apothecaries. Such of these as may not be required for military duty are lent to the Civil department. On the 1st April 1883 an Army Hospital Native Corps, consisting of ward servants, cooks, water-carriers, and sweepers, was organized for service with British troops. It consists of 400 men enlisted for general service, and is under the command of the Surgeon-General, subject to the orders of the Commander-in-Chief. On the 1st April 1882 the station hospital system was substituted for the regimental in the case of British troops, by which the number of hospitals was reduced from 27 to 19. The chief advantages resulting from the station hospital system are the concentration of the sick, the accumulation of the medical history of the successive bodies of troops occupying a station, and economy in personnel and material. The station hospital system is also in harmony with the approved organization of the Medical department of an army in the field. As regards Native troops the regimental hospital system is still in existence, and the number of such hospitals, including wings and the hospitals at Pallavaram and Vizagapatam for European invalids, is 45. There is also a dépôt hospital at Pallavaram, for the treatment of sick of Native corps invalided from Burmah. In addition to these there are garrison hospitals at Bangalore and Secunderabad, and a detail hospital at Rangoon. In connection with the Contagious Diseases Act there are 7 military lock hospitals, for the treatment of diseased women, in the larger military stations of the Presidency. The Surgeon-General is responsible for the whole medical service of H.M.'s Forces in Madras and British Burmah, and is assisted in office work by a Secretary and Statistical Officer from the Indian Medical Department. He is kept informed as to the health of the troops by weekly and other returns and reports, and all questions relating to the sickness and sanitation of military establishments are referred to him. He arranges for the posting of medical officers in communication with the Commander-in-Chief, and regulates the distribution of the subordinate medical department and Army Hospital Native Corps. The expenditure of medicines and other hospital supplies is also under his control. Deputy Surgeons-General are subordinate to, and assist, the Surgeon-General in his administrative duties, and are the advisers of general officers commanding divisions and districts in medical and sanitary matters. They have also, subject to general or other commanding officers, command of medical officers and subordinates, and of the men of the Army Hospital Native Corps serving in their circles. They are responsible to the Surgeon-General, as well as to the general officers, that executive medical officers, subordinates and hospital attendants perform their duties properly, that the sick are cared for, that sanitation is attended to, that statistics and records are regularly kept, and that economy is exercised in the expenditure of supplies and stores. The Surgeon-General and Deputy Surgeons-General inspect barracks and hospitals annually, or oftener if necessary. Executive medical officers are in professional charge of officers and soldiers and their families, and also of all military establishments. The Surgeon-General is attached to Government, and not to Army Head-quarters, and communicates with

Government through the Military Secretary. In corresponding with the Commander-in-Chief he addresses him through the Adjutant-General and Quartermaster-General. In professional matters connected with British troops, he is subject to the Director-General, Army Medical Department, and his local representative, the Surgeon-General, H.M.'s Forces, Bengal. To the Government he submits annually a brief annual report for the official year on the health of troops, British and Native, and on the working of lock hospitals. For the calendar year he furnishes, for the information of Government, report on the sickness, mortality, and invaliding of British troops, sanitary report on British troops (through the Adjutant-General), report on enteric fever amongst British troops, report on lock hospitals (through the Adjutant-General), and return of mortality with the causes of death at each station in the European Army (for the Government of India). To the Director-General, he forwards a monthly statistical return of the health of British troops, as well as various minor returns. He also prepares for the annual Blue Book, submitted to Parliament by the Director-General, a report with complete statistics of sickness, mortality, and invaliding amongst British troops, and a sanitary report.

710. CONSTITUTION OF THE INDIAN MEDICAL SERVICE.—To the Indian Medical Department are allotted medical duties connected with the Native Army and the civil administration of the country; its members are also occasionally employed by Government on scientific and other extra-professional duties. The department consists of commissioned officers specially engaged for service in India and other Eastern Dependencies, and of subordinate grades. The Surgeon-General at the head of the department, whose official designation is Surgeon-General with the Government of Madras, is entrusted with the control and superintendence of medical establishments connected with Medical Store Depôts, Civil Hospitals and Dispensaries, and medical establishments attached to the Judicial, Revenue, Police, and other Civil departments. In matters connected with the Native Army this officer is subordinate to the Commander-in-Chief. There are four Deputy Surgeons-General of the Indian Medical establishment to each of whom is assigned a circle of superintendence. The establishment of Executive Officers consists of 11 Brigade-Surgeons, 64 Surgeons-Major, and 100 Surgeons, making in all 181 medical officers including the administrative grades. Duties of Civil or Zillah Surgeons are briefly to afford medical aid to all Government servants in the Revenue, Judicial, Police, Forest, Public Works, and other Civil departments of the State; to take medical charge of Jails, Civil Dispensaries and other hospitals at head-quarter stations; to hold the office of Superintendent of District Jails, and Sanitary Officer of the district, with the superintendence of vaccination. The Civil or Zillah Surgeon in each revenue district is designated the District Medical and Sanitary Officer. His duties in addition to the ordinary duties of a Civil or Zillah Surgeon are—(a) To advise the Presidents of Local Boards and Municipalities in all matters affecting the medical and sanitary administration of the district, and to lay before those officers all recommendations for the transfer, promotion or punishment, &c., of the subordinate medical and vaccine staff of the circle or municipality. (b) To consult with, and advise, the heads of the several departments concerned in regard to all medical subordinates attached to the Revenue, Police, Jail and other Civil departments within the district, before submitting his recommendations to the Surgeon-General with the Government of Madras. (c) To inspect as frequently as is consistent with his other duties all minor dispensaries in charge of medical subordinates, and the working of the vaccine and conservancy establishments of the district, especially in the larger towns and villages. (d) To supervise and control the medical establishments of jails, dispensaries or lunatic asylums at the district head-quarters, and to perform while residing at head-quarters all the ordinary duties now devolving on Civil Surgeons. (e) To check and control all indents on the Principal Medical Storekeeper for medical stores and instruments submitted by the various medical subordinates in independent charge throughout the district, as well as all other requisitions or bills for hospital supplies. In so doing the District Medical and Sanitary Officer is expected to restrain with a firm hand all tendency to wasteful or extravagant demand for European medicines, &c.; to encourage wherever prac-

ticable the use of indigenous drugs and materials; and to bring promptly to notice all instances of wasteful use of hospital stores or extravagance in management. (f) To collect from medical subordinates, Deputy Inspectors of Vaccination, &c., and to submit to the Presidents of Local Fund Boards and Municipalities, the Surgeon-General, or the Sanitary Commissioner, as the case may be, all departmental returns required by regulation of the medical and vaccine staff of the district. (g) To supervise the tabulation of the district vital statistics. The subordinate medical establishment consists of two classes, viz., the Apothecary and the Hospital Assistant class. In addition to the Military medical subordinates lent to the Civil department there are now employed and under training three classes of medical subordinates intended for service under Government in provincial hospitals and in the hospitals of Municipalities and of Local Fund Boards. These officials are designated respectively Assistant Surgeons, Civil Apothecaries and Civil Hospital Assistants, and are purely civil officers not amenable to military discipline or ordinarily available for military duty.

711. CIVIL MEDICAL RELIEF.—The agencies for the relief of the sick poor in this Presidency are annually increasing under the operation of the Towns Improvement and Local Fund Acts. According to the latest information there were 287 hospitals and dispensaries in operation throughout the Presidency, the medical staff of which consisted of 37 Commissioned Officers, 4 Honorary Surgeons, 1 Native Surgeon, 19 Officers of the Warrant grade, 9 Military Hospital Assistants, 77 Civil Apothecaries, 93 Civil Hospital Assistants, and 47 Private Medical Practitioners, making a total of 287 medical agents. These institutions are open to all classes of the community applying for relief. Of the 287 institutions, 153 are hospitals having wards for in-patients; and 129 may be classed as dispensaries, inasmuch as they at present only afford relief to out-patients. A list of the civil hospitals and dispensaries in the Presidency is given in Vol. II, App. LXXI, and in the map, which is excluded here by necessities of publication, but will be found in the collection of maps given with Vol. III. Since the passing of the Towns Improvement and Local Fund Acts in 1871, the cost of maintaining hospitals and dispensaries has, under sanction of the law, been thrown on Municipalities and Local Fund Boards, and at the present moment the entire cost of all up-country civil hospitals and dispensaries is met by those Boards, with the exception of the pay of the medical officers when of the commissioned grade or of the grade of Honorary Surgeon. In the case of a Native or Assistant Surgeon, Warrant Officer, or Hospital Assistant holding charge of a civil hospital along with police or jail duties, or rendering other duties to the State, such as affording medical aid to public servants, &c., one-fourth of his pay ordinarily becomes a provincial charge in virtue of the latter duties. In most cases the local hospital is a joint charge on the adjoining Local Fund Circles and the Municipality in which it is situated, the expenses being divided between them. At the Presidency town the General Hospital, on account of its being a clinical school for the college students, and four other special hospitals are mainly supported by Government, the Madras Municipality contributing a lump sum annually in consideration of their utility to the general public. The cost of the Civil Lock Hospital in Madras is also partly borne by Government, but the maintenance of the other hospitals is purely a municipal charge. The Lunatic Asylum at the Presidency is maintained by Government, and at Calicut and Waltair Government support two lunatic asylums and a lazaretto at Paliport, together with civil dispensaries at the three large military stations of Secunderabad, Kamptee, and St. Thomas' Mount. Municipalities and Local Boards are required by law to maintain their civil insane patients sent for custody and treatment to the lunatic asylums. The cost of the civil hospitals on the Neilgherries is also partly met from provincial funds. The cardinal principle, however, of the existing system of medical relief for the masses in this Presidency is its maintenance by local taxation, consequently its extension depends chiefly on the action of the rate-payers. So far the new arrangement has proved no obstacle to the extension of medical relief, but would appear on the contrary to have given it a fresh impetus; dispensaries have multiplied rapidly under Local Boards, [243] and the increase in their number would have been still greater had the Medical Department been in a position to provide the requisite number of medical men

to take charge of the new institutions. The provision of medical men and their education and training were up to 1878 entirely undertaken by Government, but Local Boards are now required to provide their own medical schools, or to contribute to the maintenance of the Medical College. The Contagious Diseases Act, India Act XIV of 1868, is administered by a Health Officer specially appointed.

SANITATION.

712. INTRODUCTION.—Under this head the Government now control three things; vaccination, practical sanitation, and vital statistics.[1]

713. LAW.—The existing legal enactments in force are Madras Act III of 1871, the Towns Improvement Act; Madras Act IV of 1871, the Madras Local Funds Act; and Madras Act I of 1884, the City of Madras Municipal Act. The provisions

[1] SKETCH HISTORY OF GOVERNMENT SANITATION IN THE PRESIDENCY.—Vaccine Department.—Vaccination existed as a department before the Sanitary Department proper was instituted. In 1802 the vaccine virus was first brought to India via Persia and Bombay, and by the exertions of Dr. James Anderson it was introduced in Madras and Calcutta. Prior to that year small-pox inoculation had been encouraged by the Indian Governments. On the introduction of the vaccine virus into Madras efforts were made in this Presidency during the concluding years of Lord Clive's administration to induce the people to accept vaccination in lieu of inoculation. It was held that looking upon the cow as a sacred animal, the Hindoos would more readily accept the change. Special arrangements were made for the encouragement of vaccination. A depot was established in a central station in the Presidency under the superintendence of a skilled surgeon. His principal duty was to maintain and furnish up-country stations with supplies of vaccine lymph; and a medical officer was appointed at each superintending surgeon's station to encourage and practise vaccination. The surgeons attached to the courts of circuits were also required to prosecute vaccination in addition to attending to the medical wants of the establishment, receiving as remuneration full batta for extra expenses incurred, and ten pagodas for every hundred successful operations performed by them. Native medical practitioners also were instructed in the art and were employed in the revenue districts to practise it. Treatises were compiled explanatory of Jenner's discovery, which were translated into the vernacular languages and circulated at the expense of Government. The native practitioners received ten pagodas for every hundred successful operations performed. These arrangements were in force for about three years, when in 1805 a Superintendent-General of Vaccination was appointed and the system of payment by results was abolished. Surgeon Alexander Mackenzie was the first officer selected for the

of these Acts relating to vaccination are contained in section 26, clause III, of Madras Act IV of 1871, under which the funds raised under this Act are applicable to the purpose of training and employing vaccinators and medical practitioners; and section 378 of Madras Act I of 1884 under which vaccination is made compulsory

appointment. He was not placed under the orders of the Medical Board, but held direct communication with Government, through the Secretaries in the Revenue and Judicial Departments. The surgeons attached to the provincial and zillah courts, who were appointed vaccinators on specific salaries, were placed under his control, and his duties were to use his own personal exertions in vaccinating as large a number of patients as might be practicable, submitting monthly returns to Government; to superintend and control medical officers, European and Native, employed in vaccination; and specially to prevent any abuse. The duties of the surgeons attached to the provincial courts were, by distributing the vaccine matter and by their own personal exertions as vaccinators, to facilitate as much as possible the extension of vaccination; they were also to receive reports from the zillah surgeons and transmit them to Superintendent-General. The duties of the zillah surgeons were to extend the practice of vaccination by their own personal exertions, and by the superintendence and control of the natives employed. Four native practitioners, subordinate to the surgeons, were employed in each zillah with fixed salaries. With all the efforts made at the time, vaccination did not however find that favour with the people which the Government had expected. The Medical Board writing in 1807 observe "prejudices have led the natives to suspect even the benevolent intentions of Government, from the anxiety that was shown to diffuse vaccination, and caused them to attach to it many foolish intentions." It is to be regretted that after three-quarters of a century, these prejudices still exist among the masses of the people. One of the chief objections brought forward to vaccination was that Mairiamma, the goddess of small-pox, would be offended if artificial means were adopted to avert the malady. The obstacles to vaccination from a religious point of view were clearly foreseen by the Medical Board in 1807. After some years changes were made in the department which resulted in the abolition of the Superintendent-General and the transfer of the control of the vaccine establishments in the revenue districts to officers of the Revenue Department. This transfer was not considered productive of good results, and in 1851 the Government again placed the supervision and control under the Medical Department, giving the civil surgeons of districts the principal control. From 1851 to 1855 no material improvement took place. The civil surgeons rarely left their stations; they were consequently unable to exercise the necessary supervision and satisfy themselves by personal inspection of how the vaccinators worked, and the nature of their work. In 1855, on the recommendation of the Medical Board, five assistant apothecaries were attached to the civil surgeons in Nellore, Malabar, Coimbatore, Salem, Bellary, and Kurnool, for the purpose of itinerating from talook to talook to inspect the work of vaccinators. They were designated Circuit Superintendents of Vaccination and placed under the orders of the zillah surgeons. Their duties were to superintend the work of the native vaccinators with a view not only to advance vaccination by increasing the number of operations, but to ensure also the accuracy of the returns and to keep up a supply of pure and effective lymph. The reports of these officers disclosed a discreditable state of things, both among the vaccinators and the native officials. The vaccinators worked only on one or two days in the week and scarcely ever went out beyond the principal towns and places, near to their own settled residences. Unfortunately before the system of inspection could be continued and extended to other districts, the Bengal Mutiny in 1857 intervened, and the apothecaries who were employed as Circuit Superintendents of Vaccination were withdrawn for service in the Military Department. In 1860, when the question of the re-modelling of the Subordinate Medical Department was under consideration, it was suggested that the Vaccine Department should be incorporated with the civil branch of the Subordinate Medical Service, and that vaccinators should go through the same course of training as hospital assistants. The recommendations thus made were carried into effect in 1865, when Dr. J. Shortt, an able man of science, was appointed Superintendent-General of Vaccination and entrusted with the organization and supervision of the new establishment. The newly-organized department consisted of one Superintendent-General of Vaccination, with an establishment of 11 deputy superintendents and 145 vaccinators. Formerly there was a vaccinator appointed to each talook in a district, but under the new arrangement there were 13 or 14 vaccinators and one deputy superintendent to every two collectorates. The vaccinators worked in a body under the personal supervision of the deputy superintendent, traversing the district systematically from one end to the other so as to visit every village and hamlet in it. There were, however, two drawbacks in the revised establishment: first, the number of vaccinators was considerably reduced owing to the higher pay of the hospital assistants who were appointed as such, without a commensurate increase in the total allotment for the establishment; and, secondly, the social status of some of the hospital assistants was not what it should be, the caste of the operators being unacceptable to the people. Notwithstanding these disadvantages the intentions of Government in regard to vaccination were in a measure fulfilled for the first time since its introduction. In 1868 it was discovered that the Vaccine Department in Madras was more costly than in many other parts of India, and the expense was held to be incommensurate with the results which had been attained. The higher grades of the department were reduced. On the other hand the staff of vaccinators was increased. The staff of vaccinators was increased from 145 to 255 and divided into two classes—first and second—the former on Rupees 18 and the latter on Rupees 10 a-month, and at the unanimous request of the several Collectors, the circle system was abolished, that is to say the vaccinators instead of working in groups, as hitherto under the immediate supervision of the superintendents, were dispersed over a district, one or two being appointed to each talook. The department thus re-modelled, and under the control of the medical authorities, was paid from Provincial Funds and was in existence for seven years. In 1875 the vaccine staff in the several districts was transferred to the Local Fund Boards and were thenceforward paid from Local Funds. The Superintendent-General of Vaccination, whose duties were then restricted to inspection and report, was designated "Inspector of Vaccination," and made subordinate to the Sanitary Commissioner next to be mentioned instead of to the Surgeon-General. The reasons for incorporating the Vaccine with the Sanitary Department are given in (3). (2) *Sanitary Department.*—The Sanitary Department proper had its origin in the year 1864. During the first occupation of India by the English, the necessities of war usually determined the site of military encampments. These in course of time became permanent military cantonments, with little consideration of the sanitary questions arising out of the locality. Attention was presently drawn to the fact that the mortality at these stations among the military and other officials far exceeded that of the community residing beyond military limits, and it was, moreover, observed that an epidemic once established had a special attraction for such localities, often maintaining an existence in them for a period exceeding their course elsewhere. These circumstances induced Parliament in 1859 to nominate a Royal Commission to inquire (1) into the classes of disease and the rate of sickness, mortality and invaliding amongst the European and Native troops in India; (2) into the causes giving rise to disease whether as relates to climate or locality, faultiness in barracks, drainage, water-supply, diet, drink, dress, duties or habits of troops; (3) into existing unhealthy military cantonments and the remedies to improve their sanitary condition, also into the subject of healthy positions, sanitarium and hill stations generally, with a view to future occupation; (4) into the best construction of barracks, huts, hospitals and tents for India, and into the best means of enforcing Medical and Sanitary Police. The Royal Commission closed the inquiry in 1863 by a report, in which, as regards the condition of the European Army in India, it was found: first, that officers died at the rate of 81 per 1,000 per annum; second, that soldiers died at the rate of 69 per 1,000; third, that European civil population died at the rate of 20 per 1,000 per annum; fourth, that the mean lifetime of Europeans residing in India is shortened by 21·8 years. The Commission submitted certain recommendations based on their inquiries, and urged the appointment of local commissioners of public health in order to ensure the gradual introduction of sanitary improvements. Sanitary Commissions were accordingly appointed in the three Presidencies of Bengal, Madras and Bombay in 1864, and were so constituted as to represent the various points of view from which the subject should be considered—Civil, Military, Medical and Engineering. Their duties were partly consultative and partly administrative. They were "to give advice and assistance in all matters relating

in the town of Madras. The provisions relating to sanitation are found in sections 96 to 155 of Madras Act III of 1871 regarding the general conservancy of towns and houses therein; in section 26, clause III, of Madras Act IV of 1871, under which Local Funds may be applied to the construction and repair of hospitals, dispensaries, and lunatic asylums, to the sanitary inspection of towns and villages, the cleansing of the roads, streets, tanks and any other local works of public utility calculated to promote the health, comfort, and convenience of the people; and in sections 212 to 393 of Madras Act I of 1884, which relate to the conservancy of the town of Madras and contain general sanitary regulations. The sections of these Acts relating to vital statistics are sections 88 to 95 of Madras Act III of 1871 and sections 394 to 404 of Madras Act I of 1884. The Towns Improvement Act will cease to apply in any municipality to which the new Madras District Municipalities Act, IV of 1884, may be extended. Sections 129 to 142 of the latter apply to vaccination, sections 125 to 128 and 143 to 242 to sanitation, and sections 243 to 249 to vital statistics. Similarly Madras Act IV of 1871 will be superseded by the new Madras Local Boards Act, V of 1884, in any district in which the latter is brought into force. Sections 102 to 116 of the new Act relate to vaccination and section 95, clause III, 99 to 101, 117 and 118 to sanitation.

714. CONSTITUTION OF THE DEPARTMENT.—The entire sanitary department, viewing it as such, is made up at the present moment as follows; but it is scarcely

to the public health, such as selection of new stations and the sanitary improvement of existing stations and bazaars; to examine new places for barracks and hospitals; to advise on the laying out of stations and bazaars, the sanitary improvement of native towns, prevention and mitigation of epidemic diseases; and generally to exercise a constant oversight on the sanitary condition of the population, European and Native; to report on the prevalence, causes and means of preventing sickness and disease." In April of that year, the Sanitary Commission in Madras was formed, consisting of a President and four members, one of whom was the Secretary. The first President was a member of the Civil Service; the members were an officer of the Royal Engineers, two medical men, and a military officer. The Commission thus constituted was in existence till 1866, when a reorganization took place. From the 1st of May of that year the permanent members were dispensed with, and the duties hitherto performed by the Commission were carried on by a Sanitary Commissioner aided by a medical officer as Secretary; but whenever it seemed desirable to assemble committees for the consideration of any particular subject, then officers, Civil, Military, or Medical, best acquainted with the subject were to be associated with the Sanitary Commissioner in any part of the country where it seemed desirable. Originally the duties of the Sanitary Commissioner were chiefly of a military character, in fact the appointment was first created mainly with a view to military requirements and was connected with the Military Department, all communications with Government being submitted through the Military Secretary, and all the expenses of the department being included in the military budget. The civil portion of the Commissioner's duties however having gradually increased, it was decided in 1869 that he should thenceforward be placed under the orders of the Civil Department, and that all expenses connected with the appointment should be transferred to the civil budget. This transfer took place on the 1st of April 1869. In this same year, on the death of the then Secretary to the Sanitary Commission, the Secretaryship was abolished. The Sanitary Commissioner has now to deal with the health of the Presidency at large, and his duties lie mainly with the civil branch of the administration. The appointment, though considered purely a civil one, still admits of sanitary questions connected with the army being referred to him, and he is still an adviser of Government in its Military Department and can inspect all stations, &c., within or without the Presidency wherever Madras troops may be garrisoned. (3) *Amalgamation of Vaccine and Sanitary Departments.*—In 1876, as already stated, the Vaccine staff, hitherto paid from Provincial Funds, was taken over by Local Boards. It was argued on this occasion that the supervision and control of vaccination had been placed under the Medical Department at a time when "preventive" medicine had not been recognized as a distinct branch of the profession. Now that a separate department of Government was in existence, which took special cognizance of all public health questions, and as vaccination was nothing more than a "preventive" in regard to a particular disease, the control of the department and all questions connected therewith should properly be assigned to the Sanitary Department. The control of the Vaccine Department was accordingly at the commencement of the official year 1875-76 transferred from the Medical to the Sanitary Department, the Superintendent-General of Vaccination, whose designation was changed to Inspector of Vaccination, being made subordinate to the Sanitary Commissioner. In April 1878, the Inspector of Vaccination was constituted a Deputy Sanitary Commissioner under the designation of Inspector of Vaccination and Deputy Sanitary Commissioner, and was required to take a part in the sanitary inspection of the districts he visited. In 1880 it was decided that not only the Inspector of Vaccination and Deputy Sanitary Commissioner, but the whole of the Vaccine staff and the civil surgeons of districts should be utilized in the sanitary administration. A committee composed of the Board of Revenue, the Sanitary Commissioner, and the Surgeon-General with the Government of Madras sat to consider the details. A difficulty as to removing zillah surgeons during tour from their charge of District Jails, of which they are the Superintendents, was settled by making arrangements for the appointment of Assistant Surgeons to each district. In 1883 zillah surgeons were appointed as District Medical and Sanitary officers. Their duties, in connection with the Vaccine and Sanitary department were then defined to be:—to advise Collectors in matters affecting the medical and sanitary administration of the district, and to lay before those officers recommendations for the transfer, promotion or punishment, &c., of the subordinate Medical and Vaccine staff of the circle or municipality; to inspect as frequently as was consistent with their other duties the minor dispensaries in charge of medical subordinates, and the working of the Vaccine and Conservancy establishments of the district, especially in the larger towns and villages; to collect from medical subordinates, deputy inspectors of vaccination, &c., and to submit to Collectors, the Surgeon-General or the Sanitary Commissioner, as the case might be, all departmental returns required by regulation of the Medical and Vaccine staff of the district; and to advise the Collector in regard to the tabulation of the district vital statistics. (4) *Vital Statistics.*—Death registration was first attempted in this Presidency in 1855 in the town of Madras only. In 1863 the Royal Commissioners in their report on the sanitary condition of the army in India drew pointed attention to the absence of all information in regard to the vital statistics of the general population, and in recommending the formation of Sanitary Commissions they also urged the introduction of a scheme for the registration of the life and death statistics of the general population. Thus in 1865 an attempt was made to register the mortality of the people in the Madras Presidency by means of the Revenue Department. From that time death registration has been continued and in 1869 births as well as deaths began to be registered. The operations are still conducted by means of the Revenue Department, but monthly returns of births and deaths are forwarded to the Sanitary Commissioner.

yet organized as a distinct department. At the head of it is the Sanitary Commissioner, holding direct communication with Government. He is assisted first by a Deputy Sanitary Commissioner, who is also specially in charge of the vaccination establishment and operations, secondly by the District Civil Surgeons in their capacity of District Sanitary officers, and thirdly by the subordinate establishment of different classes. The Sanitary Commissioner himself is the adviser and referee of Government, Municipalities, and Local Fund Boards, in matters relating to local expenditure for drainage, water-supply, conservancy, vaccination and questions connected with the prevention of disease and the preservation of health. He has also the direction and control of an inspecting vaccination agency. He controls vital statistics. The inspection of municipal towns engages the special attention of the Sanitary Commissioner, while the smaller towns and villages in the interior of a district are usually inspected and reported upon by other officers. In his tours of inspection, the Sanitary Commissioner visits jails and lunatic asylums of which he is an official visitor. Notes of his inspection containing suggestions for the improvement of the sanitary condition of the places visited by him are forwarded to Government and to the district authorities. The returns which he receives and sends are shown in the foot-note.^[2] The remainder of the organization and the functions of the different officers can best be seen from the following paragraphs on the work done by the department.

715. WORK OF THE DEPARTMENT.—The vaccine establishment under the Sanitary Commissioner, as at present constituted, consists of an Inspector of Vaccination and Deputy Sanitary Commissioner, of first and second class deputy inspectors of vaccination, of first and second class vaccinators, and of probationary and volunteer vaccinators. The latter are more properly candidates preparing for admission into the department on the occurrence of vacancies. The general supervision of the department devolves on the Inspector of Vaccination and Deputy Sanitary Commissioner. He visits all parts of the Presidency for the purpose of inspecting and reporting on the vaccinators' work and the progress made in vaccination. In addition to vaccine inspection he also takes a part in the sanitary inspection of districts. Notes of his inspections on vaccination are submitted to the Sanitary Commissioner, who forwards copies of them to the Local Boards concerned. District Medical and Sanitary Officers also inspect, as frequently as is consistent with their other duties, the working of the vaccine establishment in the several districts. Immediate supervision of the vaccinators' work is carried on by the

[2] **REPORTS AND RETURNS OF THE SANITARY DEPARTMENT.**—The periodical returns and reports received by the Sanitary Commissioner, and from which he compiles and tabulates materials for his annual report, are as follows:—"a," Weekly returns of sickness and mortality of the European and Native Armies—the latter he receives direct from the Regimental Medical Officers and are retained in his office for record, while copies of the former are furnished to him by the Surgeon-General, H.M.'s Forces, which, after making such extracts as may be required by him for his report, are returned; "b," Annual sanitary reports from cantonments and military stations; "c," Monthly birth and death returns from cantonments and stations; "d," Monthly returns of sickness and mortality and annual sanitary reports from the several districts and Central Jails in the Presidency; "e," Monthly vital statistical returns of the general population from the several collectorates; "f," Monthly birth and death returns from the several municipal towns; and "g," Annual sanitary reports from Municipalities and Local Fund Boards. Besides the above, he receives separately weekly returns of births and deaths from Municipalities containing 25,000 inhabitants and upwards, which he publishes in the Gazette in one general return compiled in his office. On the outbreak of cholera in districts, daily reports of the disease are forwarded to him by the Revenue authorities, from which he tabulates one general table of attacks and deaths, and forwards copies of it to the Surgeon-General with the Government of Madras and H.M.'s Forces, to the Quartermaster-General, and the Sanitary Commissioner with the Government of India, for information. Extracts of the budget estimates relating to vaccination and sanitation of Local Fund Boards and Municipalities are forwarded to him, which he reviews and reports on to the Board of Revenue and Government as regards the sufficiency or otherwise of the proposed allotments for these objects. At the end of every calendar year the Sanitary Commissioner draws up and submits to Government an annual sanitary report, which deals with "a," the health of the general population during the year in districts and municipalities, "b," general history of chief diseases—cholera, small-pox, fevers, bowel-complaints and injuries, "c," general history of vaccination, "d," the seasonal sickness and mortality of the European and Native armies in the Madras command and the sanitary works begun, in progress, or completed during the year in each cantonment or station, "e," health of prisoners in jails, and contains "f," general remarks on the sanitary works and sanitary expenditure in Municipalities and Local Fund Boards, and "g," general remarks and a record of the personal proceedings of the Sanitary Commissioner during the year. He also submits to Government a monthly report on, and an abstract statement of, the vital statistics of the districts and municipalities in the Presidency which is published in the "Fort St. George Gazette," and forwards to the Sanitary Commissioner with the Government of India a monthly return of cholera in the Presidency. To the Registrars-General of England, Dublin and New York is likewise forwarded a weekly return of births and deaths and meteorological results in the city of Madras. The transactions of his office are published in the form of monthly proceedings which contain replies to references on sanitary subjects and all papers relating to sanitation, vaccination, &c., communicated to the Sanitary Commissioner by Government and others. These proceedings are supplied to all Local Fund Boards and Municipalities, to the several Sanitary Commissioners in India, to the Revenue, Medical and other departments; thus each local body is kept acquainted with subjects of a sanitary nature and the sanitary improvements which are being carried out in other parts of the Presidency and of India. Copies of the proceedings are also forwarded to the Government of India direct and the Secretary of State through the Madras Government.

deputy inspectors of vaccination, of whom there are one or more in each Local Fund Circle. They are all in direct subordination to the Inspector of Vaccination and Deputy Sanitary Commissioner, and their appointments, dismissals, &c., lie with the Sanitary Commissioner. They are required to be constantly on the move, travelling from village to village within their ranges inspecting the vaccinators' work. At the end of every week they submit, through the District Medical and Sanitary Officer, to the Inspector of Vaccination and Deputy Sanitary Commissioner and to the Presidents of Local Fund Boards, a diary containing notes of their inspection under several specified heads. They receive from the vaccinators weekly and monthly returns of the work done by them, from which they compile a monthly return which they forward to the Inspector of Vaccination and to the Presidents of Local Fund Boards, and at the end of every calendar year they submit to these same officers an annual report and returns of the year's transactions. The actual work of vaccination is done by the different classes of vaccinators, viz., Local Fund, Municipal, Government, Zemindarry and Cantonment vaccinators; medical subordinates attached to the Army, Civil Dispensaries, and to the Revenue, Jail, Police and Survey departments are also required to practise vaccination as far as lies in their power. Vaccinators are appointed by Local Fund Boards and Municipalities under whose orders they are. There should at least be one of the first grade in each talook and municipal town, and as many of the second grade as may be found necessary. There is no uniform minimum amount of work fixed that a vaccinator, either of the first or second class, should turn out in a month. The minimum is determined by the several Local and Municipal Boards according to the circumstances of the circle or town. With few exceptions the whole cost of vaccination in the Presidency is borne by Local and Municipal Funds. The establishments in Ganjam and Jeypore hill tracts, Gudern hills and Bhadrachellam are maintained by Provincial Funds, and Government contributes the pay and allowances of the Inspector of Vaccination and Deputy Sanitary Commissioner and Cantonment vaccinators. The salary of a deputy inspector of vaccination is to be not less than Rupees 60 per mensem for a first, and Rupees 40 for a second class, and their travelling allowance is regulated by the Travelling Allowance Code. The pay of a first-class vaccinator is to be not less than Rupees 15 a month, and that of a second-class Rupees 10 with travelling allowances, of not less than 8 and 4 annas per diem respectively. The department is regulated by a code of rules called the Vaccination Code.

716. As regards practical sanitation, the cardinal requirements everywhere are doubtless the cleansing of premises and streets, the safe removal and disposal of house sewage, and the careful guarding from contamination of drinking water. In the smaller towns it is probable that the most efficient arrangements regarding drainage, at least for the present, will be to level and improve the surfaces of public streets, lanes, and house compounds, to provide ready escape for rain and surface water by well-made impervious surface drains, properly graded to the outfall, so that all water may flow rapidly away and nowhere form surface pools, and to combine with this an efficient conservancy system, to keep as much of the house sewage as possible out of the surface drains. Shutting up bad wells and improving and protecting existing wells from subsoil pollution is another necessary step in sanitation. The Zillah Surgeons have to make tours of inspection and report on the sanitary condition of places visited by them to the local authorities and the Sanitary Commissioner, and recommend improvements where necessary. They are to advise Local Fund Boards and Municipalities on all matters affecting the sanitary administration of the district. Deputy Inspectors of Vaccination when visiting villages for vaccination purposes are required to report at the same time on the water-supply, conservancy, and public health of the villages.

717. The mode of birth and death registration differs in towns and in the country. Among the town population the Towns Improvement Act, Madras No. III of 1871, makes registration of births and deaths compulsory in the areas affected by the Act and special registrars are appointed for collecting and registering the events. In the districts among the rural population, the voluntary system still obtains and registration is effected without any special law. It has been held that the time has not yet arrived for making registration of births and

deaths generally obligatory by law in villages beyond municipal limits, but the organization of a proper system of registration by which the rural population may be gradually prepared for a compulsory law is under consideration. The system at present pursued in the rural districts of the Presidency is as follows. The curnum or village accountant keeps a record of the births and deaths occurring in his village, obtaining his information from the village dhoby or washerman and the village taliary or watchman. Revenue Inspectors supervise the registration. A monthly abstract of records thus kept, containing particulars of age and cause of death, is transmitted to the Collector through the talook authorities. The talook returns are tabulated in the Collector's office and forwarded in a monthly form to the Sanitary Commissioner, who in turn submits a monthly abstract to Government, by whom they are periodically published in the Government Gazette.

718. FINANCIAL.—The outlay on sanitation is undertaken chiefly by Local Fund Boards and by Municipalities. Sanitary expenditure by Local Fund Boards is divided technically into three classes; improvement of water-supply, enlargement or improvement of village-sites, and conservancy of towns and villages. The main source of income of Local Fund Boards is the land-cess, two-thirds of which is devoted to communications. The remaining third is available for other objects, and, though there are some minor sources of income, may be taken roughly as the income available for miscellaneous expenditure. This third is divided amongst four claimants—Education, Medicine (hospitals and dispensaries), Conservancy and Hygiene (the last including vaccination). The ratio of distribution is decided in each case on its merits. Municipal sanitary expenditure is devoted to conservancy, improvement of town-sites and water-supply, sanitary arrangements during fairs and festivals, construction and repair of drains, markets and slaughter-houses, &c. The total estimated receipts are taken as a figure on which to calculate the proportion of the sanitary allotment.

719. STATISTICS.—The table at foot [3] shows the results of vaccine operations for a series of years from 1865. In the fourth column of this statement, by primary vaccination is meant vaccination performed on a subject for the first time as opposed to "re-vaccination." The number of births is given in the fifth column to show what proportion of children born in each year was protected, which can be ascertained by comparing the number successfully vaccinated under one year of age with the births. The deaths from small-pox are given in column 6 to show the influence of vaccination thereon. The total cost of vaccination in 1883 was Rupees 1,72,177. A statement at foot [4] shows the amount sanctioned and expended for sanitary purposes in the mofussil municipalities of this Presidency in four recent official years. A similar statement for the Local Fund Circles of the Presi-

when the results in the case of births fall below 2·5 per cent. of the population, and of deaths below 2 per cent. The English birth-rate is understood to be about 3·5 and the French 2·6 per cent.; the corresponding death-rates being 2·2 and 2·3 per cent., respectively:

CHEMICAL EXAMINER.

720. DESCRIPTION OF THE DEPARTMENT.—The appointment of Chemical Examiner was instituted in 1857, when the Presidency Assay Master for the time being was appointed Chemical Examiner, without prejudice to his appointment as Assay Master. The first object of the department is to conduct the analyses required by the Courts in cases of suspected murder by poison at a central office, where appliances and skilled labour can be obtained. In addition to these analyses, examinations of various substances for the purposes of different departments are made at their instance. A code of rules relative to the mode of sending up articles for analysis in criminal cases was issued by Government in 1883, and there has since been an increase in the percentage of detections. The proportion of human cases in which poison was detected was 57·2 per cent. in 1883 against 45·4 per cent. in the previous year. In these rules it is directed that the order of a Magistrate, or Superintendent of Police, or Assistant Superintendent of Police, must be obtained before a Medical officer can forward any substance for examination in criminal cases, and also that Magistrates, &c., shall supply information as to the history of the case direct to the Chemical Examiner. An Assistant Chemical Examiner was appointed in 1882. The report of the Chemical Examiner or Assistant Chemical Examiner is received as evidence by the Courts in accordance with Section 510 of Chapter 41 of the Criminal Procedure Code. The statement at foot shows the number of cases of suspected poisoning, &c., sent up for examination from 1879 to 1883.[1]

CHAPTER VII.

ARTS AND SCIENCES.

MADRAS OBSERVATORY.

721. NATURE OF THE INSTITUTION.—The Madras Observatory [1] gives Madras or uniform time to the greater part of India for railway and other purposes. Its longitude, as that of the secondary meridian or substitute for the prime meridian of Greenwich Observatory, is the fixed point of departure of the Trigonometrical Survey of India. The pursuits carried out at the observatory may be briefly specified as follows. A catalogue of about 5,300 fixed stars, selected as requiring special observation and based upon over 50,000 observations made with the Transit Circle of Messrs. Troughton and Simms of London, has just been finally completed. Other pursuits are or have been till recently the discovery of new planets; observations of minor planets and comets, especially when such are invisible to European astronomers; researches upon the variable stars, several new ones having been discovered; the usual attention to all casual phenomena, such as eclipses, transits, occultations, phenomena of Jupiter's satellites, &c.; and an investigation of the Solar Parallax by means of observations of the planet Mars. This last was effected at eight oppositions between the years 1862 and 1879. The chief labour at present is an atlas of all known telescopic variable stars, involving the determination of approximate positions of over 60,000 stars, and the construction of nearly 200 maps,

[1] SKETCH HISTORY OF THE MADRAS OBSERVATORY.—The Madras Observatory was instituted in the year 1792, Sir Charles Oakeley being then Governor of Fort St. George, and Mr. John Goldingham the first astronomer. It originated from a small private observatory, started in 1787 by Mr. William Petrie, a scientific member of the Government, who upon leaving India presented his instruments to Government for the use of the new observatory. The principal of these, a small transit instrument by Stancliffe, is still preserved. Mr. Goldingham held office for thirty-eight years. A long series of meridional observations of the brighter stars was accumulated during this period, and two folio volumes, numbered III and IV, were published, containing the observations made between the years 1812 and 1826; leaving Volumes I and II with the observations from 1793 to 1811 for future consideration, the time for which however did not arrive. Other labors of Mr. Goldingham were investigations upon the length of the seconds pendulum at Madras and at upwards of thirty stations round Sumatra and close to the Equator; determinations of the geographical positions of Calcutta, Coringa, Masulipatam, Tranquebar, Point De Galle, Bombay and Canton; determination of the longitude of Madras by a number of observations of Jupiter's satellites; experiments upon the velocity of sound by means of the Fort and Mount guns; and a meteorological register commenced in the year 1796. Besides his duties as an Astronomer, Mr. Goldingham performed also those of Government Architect, the present Banqueting Hall being one of his labors about the year 1800. He died at Worcester in February 1849. The second Astronomer, Mr. Thomas Glanville Taylor, had charge of the observatory from 15th September 1830 to the commencement of the year 1848. Furnished with much superior instruments he completed a general catalogue of 11,015 fixed stars, which renders his name familiar in astronomical annals. Other casual observations of eclipses, comets, and minor phenomena also marked this period. Mr. Taylor's published results, all in quarto size, consisted of seven volumes of astronomical observations; one of Madras hourly meteorological observations; one of Singapore hourly meteorological observations, and one of Singapore hourly magnetical observations; all three for the years 1841 to 1845. The next decade in the history of the observatory, viz., from 1849 to 1859, was under the direction of Captain W. S. Jacob, of the Bombay Engineers; and was distinguished by the introduction of new investigations of a scientific nature, rendered possible with extra meridional instruments, then for the first time obtained. With an equatorial constructed by Messrs. Lerebours and Secretan, he made numerous measurements of double stars and of the satellites of Saturn and Jupiter, publishing the results partly in an eighth quarto volume of Madras astronomical observations, and the rest in Vol. XXVIII of the "Memoirs of the Royal Astronomical Society." A second volume of Madras hourly meteorological observations, and one of Madras hourly magnetical observations; each for the years 1846 to 1850; as well as one of very imperfect hourly meteorological observations, made at Dodabatta, the highest point of the Nilgerry hills, between 1847 and 1856 were also printed under Captain Jacob's direction. The observatory was in charge of Major J. F. Tennant, R.E., in portions of 1859 and 1860. A still unpublished promiscuous star catalogue was made by Major W. K. Worster, R.A., while acting before and after this time in the appointment. Since 1861 the observatory has been in the hands of the present Government Astronomer. A new transit circle, and a larger equatorial, both by Messrs. Troughton and Simms, and several other new and improved minor appliances, have been obtained. Most of the results of subsequent years have yet to be made public. Those already issued are:—Madras hourly meteorological observations for the years 1851 to 1856; Madras hourly magnetical observations for the same years—both quarto volumes—a pamphlet report upon the total eclipse of the sun on August 18th, 1868, as observed at Masulipatam, Vanapurty, Madras and other stations in Southern India; and recently, a small quarto volume, "Telegraphic Determinations of the difference of longitude between Kurrachee, Armaahy, Roorkhee, Pondicherry, Colombo, Jaffna, and Singapore, and the Government Observatory at Madras, made between 1870 and 1875."—Discoveries; some observations of immediate interest and occasional papers have also been communicated to the "Astronomische Nachrichten"; the "Monthly Notices of the Royal Astronomical Society" and other periodicals.

for the epoch 1900. An account is given in the next foot-note [2] of discoveries made by the present Astronomer from the period of his taking charge of the observatory to the present date. The next note [3] shows in detail the works at

[2] SKETCH ACCOUNT OF PLANETARY, COMETARY AND STELLAR DISCOVERIES MADE BY THE PRESENT ASTRONOMER AT MADRAS—Minor Planets between the Orbits of Mars and Jupiter.—Six of these have been discovered down to the present date, as shown in the following table, Mr. Pogson having found four minor planets previously at Oxford :—

Name.	Date of discovery	Period of revolution.
Asia	1861, April 17	Y. M. D. 3 9 5
Freia	1864, February 2	6 3 23
Sappho	1864, May 3	3 5 22
Sylvia	1866, May 16	6 6 0
Camilla	1868, November 17	6 6 7
Vera	1888, February 6	5 4 24

Asia was so named on account of its being the first astronomical discovery made in that quarter of the globe. Freia was first discovered by Professor D'Arrest, at Copenhagen, 1862, October 21st; but was lost owing to insufficient observations having been secured to render the calculation of its orbit definite. It was rediscovered independently at Madras. (2) Comet—either Biela's or a new one.—A bright telescopic comet was found at Madras, 1872, December 2nd. It remains a disputed point whether this was a rediscovery of the lost periodical comet of Biela or whether the comet was a new one. Cloudy weather prevented it from being observed on more than two nights and hence the uncertainty; but it is now generally supposed to have been a new comet. (3) New Variable and Temporary Stars.—Eight of these have been discovered down to the present date, as shown in the following table :—

Name.	Date of discovery	Limits of magnitude.	Period of variation.
Y Virginis	1862	10th to Invisibility	Unknown.
U Scorpii	1863	9th to do.	Temporary.
U Ophiuchi	1863	9th to 11th	Unknown.
T Sagittarii	1863	8th to Invisibility	381 days.
W Canori	1864	11th to do.	Unknown.
Z Virginis	1865	10th to do.	Do.
X Capricorni	1865	10th to do.	Do.
R Centauri	1877	8th to 13th	Do.

[3] LIST OF WORKS AWAITING PUBLICATION AT THE MADRAS OBSERVATORY—*Madras Astronomical Observations, in eleven volumes; with the Transit Instrument and Mural Circle prior to 1860, and with the Meridian Circle from 1862 to 1884.*—“a.” A quarto volume of about 300 pages, containing observations made under the successive superintendence of Mr. T. G. Taylor; Captain W. S. Jacob, Bombay Engineers; and Major W. K. Worster, Madras Artillery, all prior to 1860. These observations comprise 1,831 of the sun, 345 of the moon, 1,080 of the principal planets, 333 of minor planets, and 25 of Donati's comet of 1858; also a long list of occultations of planets and stars and of the eclipses of Jupiter's satellites. “b.” Separate results of observations made with the transit instrument and the mural circle in 1853, 1854, 1855 and 1856, with the deduced catalogues for each year. “c.” Separate results of observations made with the transit instrument and the mural circle in 1857, 1858 and 1859, with the deduced catalogues for each year. “d.” Separate results of 5,761 observations made with the new meridian circle in 1862, 1863 and 1864, with the deduced catalogues for each year. “e.” Separate results of 7,651 observations made with the meridian circle in 1865, 1866 and 1867, with the deduced catalogues for each year. “f.” Separate results of 5,887 observations made with the meridian circle in 1868, 1869 and 1870, with the deduced catalogues for each year. “g.” Separate results of 5,603 observations made with the meridian circle in 1871, 1872 and 1873, with the deduced catalogues for each year. “h.” Separate results of 4,639 observations made with the meridian circle in 1874, 1875 and 1876, with the deduced catalogues for each year. “i.” Separate results of 9,637 observations made with the meridian circle in 1877, 1878 and 1879, with the deduced catalogues for each year. “j.” Separate results of 5,817 observations made with the meridian circle in 1880 and 1881 with the deduced catalogues for each year. “k.” Separate results of 6,747 observations made with the meridian circle in 1882, 1883 and 1884 with the deduced catalogues for each year. In the publication of these volumes, it is not intended to print the actual details of observations, as still given in the volume of the Greenwich, Edinburgh, Washington and other national observatories. In consideration however of the impossibility of preserving original records for a number of years in India, it will be desirable that carefully compared manuscript copies of the complete reductions should be deposited at the India Office, at the Royal Observatory, or with the Royal Astronomical Society, available for future reference, should the necessity for such arise. (2) *Final Star Catalogues.*—“a.” Catalogue of about 2,200 stars for the epoch 1855, from observations made with the transit instrument and mural circle, between the years 1853 and 1858; under the superintendence of Captain W. S. Jacob, Bombay Engineers, and Major W. K. Worster, Madras Artillery. “b.” Catalogue of 5,290 stars for the epoch 1875, from observations made with the meridian circle, between the years 1862 and 1884; under the superintendence of Mr. N. R. Pogson. “c.” Catalogues to accompany the Variable Star Atlas, containing approximate positions of upwards of sixty thousand stars, observed entirely by Mr. Pogson and reduced to the epoch 1900, at Madras, since 1861. (3) *Subsidiary Volumes and Pamphlets.*—“a.” Observations of minor planets, comets and new variable stars and nebulae: furnishing 989 positions of 73 minor planets at 260 oppositions; 75 of 10 comets; those of such variable stars as are not observable with the meridian circle; and of two new nebulae, in Ara and Phoenix, discovered by the Assistant Astronomer, Miss Pogson, in 1876 and 1881. “b.” Transit of Mercury, November 12, 1861; transit of Venus, December 8, 1874; six eclipses of the sun; seven eclipses of the moon; five occultations of planets; numerous star occultations between 1862 and 1880. Phenomena of Jupiter's satellites on 193 occasions between 1862 and 1880; measures of a Centauri, γ Virginis and a few other double stars; spectroscopic measures of γ Argus. “c.” Light comparisons of telescopic variable stars on about 2,200 occasions, between the years 1861 and 1881. “d.” Determination of the Constant of Solar Parallax, by means of 212 differential measurements of the planet Mars, in right ascension, from adjacent comparison stars; made with the equatorials on 104 evenings near the rising and 106 mornings near the setting of the planet at its eight oppositions in the years 1862, 1864, 1869, 1871, 1873, 1875, 1877, and 1879. (4) *Variable Star Atlas and other Star Charts.*—“a.” An atlas of variable stars containing maps of the vicinity of each known telescopic variable, which, at its minimum, becomes invisible to the naked eye. These maps, about 200 in number, are each eighty minutes wide in Polar Distance and nearly square, on a scale of three inches to a degree, and will contain all stars easily visible with a telescope eight inches in aperture. The magnitudes of a certain number of comparison stars, adjacent to the variable near the middle of each map, will be given, on a photometric scale in which the logarithmic light ratio is 0.4 and the limit of vision or of extinction, for an object glass exactly one inch in aperture, is 9.2 magnitude. The limit or extinction point for any other aperture is given by the formula—Magnitude = $9.2 + 5$ (logarithm of aperture in inches). It is estimated that these maps, when completed, will contain upwards of sixty

the observatory which await publication. Magnetical and meteorological observations are still continued at the observatory, but upon a reduced scale, consisting of three observations per day, instead of hourly, as before 1861.

METEOROLOGY.

722. INTRODUCTION.—A general account of the meteorological characteristics of the Presidency will be found in Vol. II, Appendix II. The figures opposite certain stations in Vol. II, Appendix LXVI, show in one view the rainfall of the Presidency. A map showing the same is excluded from this place by the exigencies of publication, but will be found in the collection of maps given with Volume III. The statistics at foot ['] give the mean average monthly rainfall in each revenue district taken as a whole for the four years from 1881 to 1884. The stations selected in this table are those to which rain-gauges have been supplied by the Government Astronomer, capable of furnishing returns not more than half an inch in error in each hundred inches of rainfall. The total number of stations taken is 225 in 1881, 222 in 1882, 221 in 1883, and 218 in 1884; average 225 stations. The figures under 'rain' indicate inches, with two places of decimals. The inches imply that a horizontal impermeable surface of the extent of the horizontal section at top of the funnel-shaped rain-gauge would be to that extent under water if all the rain falling upon it within the month were there retained. What is true of the small surface indicated by the rain-gauge is assumed to be true of the general area of the surrounding country. The decimal figures under 'days' are for

thousand stars and each map will be supplemented by a catalogue of approximate positions of the objects it contains, reduced to the epoch 1900. The epoch 1860 was at first adopted when the work was commenced at Oxford in 1853, but it has now been found desirable to reconstruct the maps and bring up all the star places to a future instead of a past epoch. The atlas of variable stars is the work of one individual throughout, and the zone observations and magnitude determinations can only be carried on satisfactorily when the moon is absent, the sky quite free from haze, and when official duties give sufficient leisure. "b." Eighteen star charts, chiefly constructed at Oxford, but since continued at Madras. Twelve of these maps connect Mr. Bishop's Ecliptical Charts, constructed by Mr. J. R. Hind at the South Villa Observatory, and those published by the Berlin Academy, the work of various European astronomers. The other six are maps of portions of the zodiacal heavens made on various occasions for special planetary searches. Most of the new planets and variable stars discovered by Mr. Pogson were found in the course of construction of these maps. (5) *Madras Magnetical and Meteorological Observations.*—"a." Quarto—hourly magnetical observations made at the Honorable East India Company's Magnetical Observatory at Madras, between the years 1841 and 1845, under the superintendence of Captain S. C. F. Ludlow, Madras Engineers. The observations made between the years 1846 and 1850 were published in 1854, and those between the years 1851 and 1855 have been since printed and distributed. "b." Quarto—hourly magnetical observations made at the Madras Observatory between the years 1856 and 1860, under the superintendence of Majors W. S. Jacob, Bombay Engineers, W. K. Worster, Madras Artillery, and J. F. Tennant, Bengal Engineers. "c." Quarto—hourly meteorological observations made at the Madras Observatory between the years 1856 and 1860, under the superintendence of Majors W. S. Jacob, Bombay Engineers, W. K. Worster, Madras Artillery, and J. F. Tennant, Bengal Engineers. "d." Meteorological and magnetical observations made at the Madras Observatory since the year 1861, under the superintendence of Mr. Pogson. "e." Results of meteorological observations made at Bangalore, Bellary, Cochin, Coimbatore, Kurnool, Masulipatam, Negapatam, Salem, Secunderabad, Trichinopoly and Wellington between the years 1868 and 1880, under the superintendence of Mr. Pogson.

quarter-days, and the total figure under that column indicates the number of quarter-days or periods of 6 hours during which rain fell during the whole month. Thus 1·25 indicates that rain fell on 5 quarter-days during the month. The gauges used in this Presidency are those known as Symons's. They are tested by the Government Astronomer. The test is applied to the size of funnel of the gauge and contents of glass measure into which the accumulated water is poured by the observer, so that the uncertainty may be within 0·005 per inch of rainfall. For converting into 'inches' the contents of any ordinary measure not graduated for that special purpose, it may be noted that with a circular funnel of which the upper horizontal segment is 14·854 inches in diameter, 100 fluid ounces of water represent one inch-depth of rain. If the contents of the measure are known in cubic inches only, a cubic inch divided by 1·733 is equal to one fluid ounce. The following principles are generally maintained in the management of rain-gauges. They are placed on level ground, and the receiving surface is fixed so as to be completely level. Exposure to wind is avoided. They are placed at least as many feet from trees, buildings, &c., as these are high. In the rare case of the occurrence of snow, one-twelfth of the average depth is counted as rain. Hail is allowed to melt in the funnel, and the water is measured as rain. The water condensing from dew and fog is measured as rain, where it is measurable. The next [1] table shows

thermal statistics for principal separate stations in and connected with the Presidency as observed on a recent average. The figures indicate the degrees of the thermometer registered as a mean temperature of the air in the shade night and day for the whole period of the quarter-years and years respectively. The thermometer used in India is on the Fahrenheit scale, according to which the temperature of melting ice is 32° , and that of the steam of water boiling under barometrical pressure of 30 inches is 212° . The thermometers (dry-bulb) are so placed that they are always in shade and unexposed to direct insolation, and that they are free from influence by radiation from walls and other objects. The bulbs, freely exposed to the air, are placed about 4 feet from the ground. The thermometers are usually suspended from a slight wooden frame standing in a shed with double-sloping thatched roof, open completely at the ends and at the lower part of the sides, with no trees or buildings close by. The shade maximum thermometer is mercurial. By a contraction in the stem, it is arranged that the highest portion of the column shall remain fixed at its extreme point, the remainder falling down as chilled. Continuity is afterwards restored by tapping or shaking the instrument. The thermometer is placed nearly horizontally, with the bulb somewhat lowered. The shade minimum thermometer is alcoholic. It is inclined like the maximum thermometer, and a steel index within sinks with the liquid to the lowest point, but the liquid has not the force to raise it on the return action. The index is replaced by the observer with the use of a magnet. Mean temperature is the mid-point of the range, or the arithmetical mean between the two registered extremes. Where hourly observations are possible, the mean is obtained by adding together the degrees to one place of decimals noted hourly, and dividing the sum by 24. An approximate method is also to add together the minimum noted temperature and the degrees observed at two or three fixed hours in the day, and divide the sum by 4. The hours of observation at principal observatories are 10 a.m., 4 p.m., and 10 p.m. A closer approximate method is to record the maximum, the minimum, and two other observations taken at any hour of the day or night; to take from a reduction table which has been specially constructed at the Madras Observatory certain factors answering to these 4 figures; to multiply the range by the mean of the 4 factors; and to multiply by such ultimate factor the mean of the 4 original observations. The result gives a true mean temperature for the day. The reduction table above mentioned varies for the season. The maximum temperature of the day on land occurs between 1 p.m. and 2 p.m., or after the culmination of the sun; the minimum between 5 a.m. and 6 p.m., or immediately before sunrise. The next foot-note [3] gives a sketch of the origin and progress of meteorological operations in Southern India.

[3] SKETCH HISTORY OF METEOROLOGICAL OPERATIONS IN SOUTHERN INDIA.—*Observations by Medical Officers.*—The first meteorological observations in this country were made by medical officers at stations and hospitals, these officers being expected to keep journals of such observations from a very early period; but much of this early material is lost. (2) *Observations by Meteorological Department.*—A complete series of observations has been registered at the Madras Astronomical Observatory since 1796 by the different astronomers in charge. In 1819 the hours of observation were sunrise, noon, 2 p.m., sunset, and 9 p.m., and the entries were the readings of the thermometers, rain-gauge, wind, and weather. From 1837 the hours of observation were 10 a.m., 4 p.m., and 10 p.m. Hourly observations were taken from March 1841 to February 1861, when the series was considered complete, and discontinued as no longer necessary. Since 1861 observations have been registered thrice daily, and were published weekly in the 'Fort St. George Gazette,' until recently as mentioned in the text. In 1846 the Court of Directors gave orders that a series of meteorological observations should be taken at a considerable height above the level of the sea, on the Neilgherry Hills. A building was accordingly erected on the summit of the peak of Dodabetta, 8,610 feet above the sea, and instruments were there fixed in January 1847, under the charge of John deCruz, an assistant at the Madras Observatory. The hours of observation were 9-40 a.m. and 3-40 p.m., the supposed hours of barometrical maxima and minima on the 21st and 22nd of each month, horary observations were taken for 24 consecutive hours. This experiment eventually proved a failure from various causes. The observations of atmospheric pressure and rainfall, though not accurate, were moderately good, but the thermometric observations were inferior. In consequence of the unsatisfactory results obtained, this station was abolished by Sir Charles Trevelyan in 1868. The observatory at Trivandrum, which owed its origin chiefly to the interest taken in the matter by the late Rajah of Travancore, was established in 1836, on a hill 180 feet above the sea, the first astronomer being Mr. John Caldecott. General Cullen also had observations taken to ascertain the rainfall, from 1842 to 1846, at Cochin, Quilon, Alleppey, Cape Comorin, and other points on the Travancore coast. The best and most extensive observations in Travancore, however, were made by Mr. John Allan Brown, who became astronomer to the Rajah of Travancore in January 1852, by whom in 1855 a branch observatory was established on the peak of Agastya, 6,200 feet above the sea. In reaching this lofty site, paths had to be cut through jungles occupied by wild elephants, and there were delays owing to labourers absconding from fear and cold. The assistants at this observatory were arranged into three sets of four men each, according to their castes, consisting respectively of Syrian Christians, Brahmins and Shoodras, and Roman Catholics; these sets relieved each other every three months. The observations were commenced on July 1st, 1855, but during Mr. Brown's absence in England in 1860 the observatory was allowed to fall to pieces. On his return in 1863 he had it rebuilt and took a second series of observations, extending over ten months. When the Travancore Government decided on abolishing the observatories in 1865, Mr. Brown obtained leave for the continuation of the limited series to be made by the two oldest and best of his native observers, and his principal assistant continued in charge, and forwarded reports to Mr. Brown in Europe. Sir John Herschel's suggestion, that horary observations should be taken for 24 hours together on four fixed days of each year,

723. METEOROLOGICAL DEPARTMENT.—The special Meteorological Department of the Presidency, which is part of an Imperial scheme, is in charge of a Meteorological Reporter, who is under the orders of the Meteorologist to the Government of India, but is attached to this Government. The present subordinate establishment of this department consists of four assistants at Madras and nineteen assistants employed at the seventeen up-country observatories, two assistants being necessary in two cases. The table at foot[*] gives a list of the meteorological observatories of the Presidency under the special department, showing the dates on which they were instituted, with their latitudes, longitudes, and heights above sea-level. The principal Observatory at Madras is situated in the suburb of Nungumbaukum, about 3 miles from the shore. The barometer which has been in use there since the end of 1876 is a Newman's standard (No. 49) with a large tube, similar to the instruments in use at Calcutta and Bombay. For many years previously to 1877 a similar barometer, No. 42, also by Newman, had been registered. The elevation of the barometer cistern is 22 feet above sea-level. The thermometers are all corrected to the readings of a Kew standard furnished in 1861, and are exposed under a thatched shed with open gable ends. The anemograph is one on the principle of Beckley's, and was constructed by Messrs. Adie. It has been in use since 1864. Observations are recorded three times daily at the twelve original observatories, viz., at 10 a.m., 4 p.m., and 10 p.m.; and twice daily, omitting the night records, at the six third-class observatories, Amindivy, Cuddapah, Kurnool, Mangalore, Mercara and Rajahmundry. The assistants

received due attention from the Madras observers. Such observations were registered at the Madras and Trivandrum observatories in December 1836, and January 1838. In 1832 observations were taken in the hill regions of Wynaud and Coorg giving the monthly means of the barometer, thermometer, and hygrometer. In 1865, the Madras Sanitary Commissioner, Mr. Ellis, submitted a scheme for recording meteorological observations at each of the chief civil and military stations, which received the sanction of the Supreme Government. The stations are under the superintendence of the senior medical officer, and the copies of the registers are forwarded half-monthly to the astronomer at Madras, for reduction. The Secunderabad register dates from July 1863, that of Trichinopoly from July 1866. The establishment of the other meteorological stations was sanctioned in 1867. The intention was that observations should be made with properly compared instruments, and that really reliable results should be obtained. Meteorological reporters were appointed for five provinces, Madras, Bombay, Bengal, the Central Provinces, and the North-West Provinces, with assistants in the various up-country stations, in correspondence with the Meteorological Superintendents, but acting under the immediate orders of the local medical officer. The stations of the Madras Presidency were twelve in number, viz., Bangalore, Bellary, Cochin, Coimbatore, Kurnool, Madras, Masulipatam, Negapatam, Salem, Secunderabad, Trichinopoly and Wellington; and with the exception of Kurnool, which was closed in 1876, these observatories have been carried on ever since. At the end of 1874 a Meteorologist to the Government of India was appointed at the head of the whole establishment. The former local reporters were still retained, and the Madras and Bombay registers were left as before under the control of the Government Astronomers of those Presidencies. In 1875 the Meteorologist to the Government of India issued the first report on the meteorology of the whole Indian empire. He has continued to report each year since with tables from 386 stations on the following heads:—temperature of solar radiation, temperature of nocturnal radiation, air temperature, atmospheric pressure, anemometry, hygrometry, cloud proportion, and rainfall. In July 1881 the Meteorological Office in Madras was transferred, partly at the request of the Astronomer, to a separate reporter. From the 1st of January 1882 the two third class stations at Mangalore and Mercara were placed under the Madras branch. In February 1883 Kurnool was reopened as a meteorological observatory of the third class, and two others sanctioned some time back, Cuddapah and Rajahmundry, were opened lately. It is now proposed to have an observatory, similar to those first established, recording observations three times daily, at Ootacamund. (3) *Rainfall Observations by Revenue Officers.*—A system of registering the rainfall in each district was introduced under orders of the Madras Board of Revenue in March 1852. The registration was confined to the huzoor and talook headquarter stations. From these returns a general statement for the whole district was prepared by each Collector and submitted to the Board of Revenue before the 15th of each month, for the information of Government and for quarterly publication in the Fort St. George Gazette. Subsequently the rainfall was ordered to be given in four sections for each district, viz., north, south, east, and west. The average for each section was then given instead of the actual falls. In 1862 the Board directed Collectors to furnish the Government Astronomer with a copy of the rainfall register submitted every month, and also with the past daily registers of rainfall from 1852. The Government Astronomer then suggested a new form, which was circulated for adoption. Information regarding the average rainfall for each district is available in the Revenue Board office from 1853-54. The Government Astronomer further suggested some improvements in the rain-gauges then in use, and it was decided that the duty of supplying rain-gauges should in future be entrusted to him. Existing arrangements will be seen in the text.

employed at the former stations have been instructed in their duties at the Madras Office, and reduce their own observations fit for publication; but those of the latter, being in most cases Telegraph Masters or Post Masters, record the readings at the times stated and forward weekly returns to the Madras Office for reduction there. All the observations, whether reduced or unreduced, undergo revision at the Madras Office. In December 1881 hourly observations on four days in each month were begun at the Bellary and Trichinopoly observatories. Synoptic observations, taken daily at the local time corresponding to 7 a.m. Washington mean time, for the "United States International Weather Bulletin," were at the same time begun at these two stations. All instruments for up-country are compared with the Madras standard before issue. The dry and wet bulb thermometers are tested in ice for verification of their freezing points, and compared in water with a new standard at high temperatures. The anemometers are checked prior to use by the large anemograph at the Madras Observatory; a necessary precaution as such instruments by the same maker, and apparently similar in all respects, are found to differ 25 per cent. in the recorded velocities under the same conditions of exposure. The reduced results of all meteorological observations are forwarded to the Meteorological Reporter to the Government of India, who prints them in the "Annual Report on the Meteorology of India," as also in Daily and Monthly Registers. The 10 a.m. observations from all stations are telegraphed to the Meteorological Reporter to the Government of India and incorporated in the "Revenue and Agricultural Department Daily Weather Report" published by the Government of India at Simla or Calcutta. Monthly mean and extreme results of the meteorological observations taken at each of the observatories in the Presidency were formerly printed in the Fort St. George Gazette for public information, but have been discontinued of late. It is now intended to begin publication again. The meteorological observations made at the Astronomical Observatory are communicated to the Meteorological Reporter, whose office is located in the Observatory.

724. REVENUE DEPARTMENT.—The 318 stations at which rainfall is registered by the Revenue Department are shown in Vol. II, App. LXVI. No establishment is maintained in the districts for registering the rainfall. Rain-gauges and glass-measures are in process of being supplied through the Government Astronomer, who has already supplied 224 stations. The remainder are supplied by the Superintendent of the Public Works Workshop. Weekly reports of rainfall from the different stations are sent by Collectors direct to Government, who telegraph a summary as regards the selected districts of Ganjam, Kistna, Bellary, Kurnool, Chingleput, Tanjore, Madura, Coimbatore, and Malabar to the Government of India each Wednesday. Monthly statements, showing the daily rainfall at each station supplied with a gauge, are furnished to the Board of Revenue with the season reports. These results are tabulated and submitted to Government. A copy of the monthly statements is sent by Collectors to the Government Astronomer, who publishes the results in the Fort St. George Gazette. The statistics however thus shown by the Government Astronomer relate to only the 224 stations, to which rain-gauges have been sent through his office. Collectors also report direct to the Meteorological Reporter to the Government of India the rainfall at 65 selected stations. These stations will be found indicated in Vol. II, App. LXVI.

725. SANITARY DEPARTMENT.—This department publishes rainfall results in its annual report, but they are obtained from the monthly statements in the Fort St. George Gazette mentioned in the last paragraph.

GEOLOGY.

726. INTRODUCTION.—The greater part of the Madras Presidency consists geologically of old crystalline rocks belonging to the great metamorphic or gneissic system, which forms the basis on which rest all the newer formations. Except in the case of the Cuddapah and Kurnool series (the equivalents respectively of the Upper Transition and Lower Vindhyan series of Central India), the newer forma-

tions occur only as comparatively narrow fringes occupying positions parallel to the coast lines of the peninsula. The Cuddapah and Kurnool rocks however (which consist chiefly of quartzites, conglomerates, slates and limestones) cover a large area in the North Arcot, Cuddapah, Kurnool, Anantapore, Nellore and Kistna districts. The most important of the newer systems represented in the Madras Presidency are the Lower and Upper Gondwana systems, the former of which includes the Baraukar or Indian coal measure series. The Lower Gondwanas cover small areas in the Godavery district, but are not known to occur south of the Kistna river. The Upper Gondwana system is represented by patches of sandstone and shale occurring at frequent intervals down the eastern coast as far south as Trichinopoly district. These beds are most largely developed in the northern half of the Chingleput district. In Trichinopoly the Upper Gondwana beds akin to the Rajmahal are overlaid by a series of rocks (sandstones, clays and coralline limestones) representing the Cenomanian, Turonian and Senonian groups of the cretaceous system of Western Europe. The patches of Upper Gondwana and cretaceous rocks are generally overlaid along their eastern boundaries by fringing beds of Cuddalore sandstones, and these again by the lateritic formations, which in their turn dip eastward under the recent fluviomarine coast alluvium. The Gondwana and cretaceous rocks are, as far as at present known, entirely wanting on the western coast of the peninsula, and the later formations rest there directly on the gneiss. The soils, amongst which red soils predominate, are generally formed by decomposition of the underlying rocks; the one exception to this rule being the regar or black-cotton soil, which occurs in extensive stretches in the Bellary, Anantapore, Kurnool, Kistna, Nellore, South Arcot, Madura and Tinnevely districts. By far the greater part of the regar spreads represents the humus formed by ancient forest growths. A detailed sketch of the geology of the Presidency will be found in Vol. II, App. III

727. GEOLOGICAL SURVEY.—The department is Imperial and not connected with this Government. A sketch history of its origin and progress is given in the first foot-note,^[1] and a special account of the work done in this Presidency in the next foot-note.^[2]

ARCHÆOLOGY.

728. INTRODUCTION.—The most primitive remains which come under the scope of archæology are natural caves enlarged by the hand of man, and used as dwelling places or for other purposes. A few of these have been discovered in

[1] SKETCH HISTORY OF THE GEOLOGICAL SURVEY OF INDIA.—In 1818, when the science of geology was in its infancy, Dr. Voysey joined the Trigonometrical Survey of India as its geologist and surgeon. He explored many parts of the peninsula, from Agra south through the Deccan to the Kistna, including the valleys of the Tapy and the Godavery and the diamond mines. The survey officers and many of the officers of Indian Engineers and Artillery not on the staff of the survey, reported on the rocks, their minerals and fossils, in various districts and provinces. Of non-official explorers and observers the most able were the French naturalist, Jacquemont, especially in Reewah State, where valuable coal has lately been discovered; Stephen Hislop, missionary of the Free Church of Scotland, especially in Nagpore and the rich coal strata since worked there; and Dr. Buist, the Bombay editor and savant, whose premature death, like that of Hislop, Jacquemont, and Voysey, was a loss to science. In 1833 Mr. James Calder published in the eighteenth volume of the Asiatic Researches the first brief summary of Indian geology. Its special value lies in the correct indication at that period of the general distribution of the overlying trap in Central and Western India, and of the prevalence of granitic and gneissic formations not only in the peninsula but throughout the Himalaya. Captain Newbold from Kurnool, where he was Assistant Resident, personally investigated much of the geology of Southern India, of which from 1844 to 1860 he published a summary, still of much value as acknowledged by the professional reporters of the geological survey. With the one exception of associating the rocks of the Gondwana system with the ancient 'diamond sandstone' of transition or Vindhyan age, his observations are still regarded as correct. He arranged the sequence as follows:—The metamorphic rocks; the diamond sandstone and limestone; the cretaceous (fossiliferous) limestone of Pondicherry; the freshwater limestones and cherts intercalated with the Deccan traps; the laterite, with which the Cuddalore sandstone and marine sandstone of Ramnaud and Cape Comorin are associated; the older alluvium, including regar or black-cotton soil, and kankar or nodular limestone; the modern alluvium and sand dunes; such plutonic rocks as granite and greenstone; and the newer or overlying trap. In 1854-57 Dr. Carter published a more extensive but less valuable summary and reprint of papers on the geology of the whole of Peninsular India, and Mr. Greenough exhibited to the British Association the first Geological Map of India. The growing importance of the carboniferous formation in the Damodar valley, where coal was first worked in 1777, led to the appointment by the East India Company in 1845 of Mr. D. H. Williams as Geological Surveyor, succeeded by Dr. McClelland. In March 1851 Dr. Oldham, Professor of Geology at Trinity College, Dublin, first organised the regular geological survey under Lord Dalhousie, then Governor-General. In 1856 Lord Canning ordered a systematic survey by an increased staff to be carried out in districts of which the revenue and topographical surveys had completed the maps and which promised the most valuable results, economic and scientific. Notwithstanding delays due to the want of maps and to a frequently insufficient staff the results, both scientific and practical, have been highly satisfactory. They are published

Southern India. Two have attracted special notice at Gootticondah and Shingarootla near Caurampoody in the Pulnaud talook of the Kistna district, the former being of extraordinarily large dimensions. At Belliky near the foot of the Coonoor ghaut leading to the Neilgherries are two remarkable rock-cut caves. Some ancient mounds of large size composed of scorious ashes are found in different places. They are said to be artificial, but their origin is doubtful. See in particular Coodatany and Nimbaupooram in Vol. III. Stone monuments grouped by European antiquarians under the titles of rock shrines, groups of placed rocks, barrows, cairns, dolmens, menhirs, and cistvaens, are found throughout the country. They are scarce in certain districts, as in Cuddapah, Nellore, Tanjore, and Trichinopoly; but it is not known that any district is entirely without them. Those in North

periodically in the illustrated series of memoirs and records belonging to the survey, and in the work entitled *Paleontologia Indica*, in which there are figured and described by competent authorities the flora and fauna of Indian geological periods. To the general reader, as well as to the geologist not familiar with India, the most important result of the thirty years' survey is the *Manual of the Geology of India*, chiefly compiled from the Observations of the Geological Survey, by Mr. H. B. Medlicott, its present superintendent, Mr. W. T. Blanford, late senior deputy superintendent, and Mr. V. Ball, long one of the surveyors, in four volumes (1879-81), of which one forms a map on the scale of 64 miles to the inch. The survey possesses a museum, library, and mining record office in Calcutta.

[2] SKETCH HISTORY OF THE WORK DONE BY THE GEOLOGICAL SURVEY OF INDIA IN THIS PRESIDENCY.—*Introduction*.—The following notes show the work done by localities. The desirability of a rigidly systematic survey of the country has been always recognised by the heads of the department, but several causes have militated against it. Two causes may be specially mentioned: namely, the demands of Government for special information as to the existence and mode of occurrence of valuable minerals, such as coal, gold and iron, and the necessity of determining certain questions of scientific interest relating to the homotaxis subsisting between the fossiliferous cretaceous and jurassic rocks of the eastern coast and others in different parts of India, or elsewhere. These causes have not appreciably diminished the aggregate outturn of work, but they have given rise to many interruptions. (2) *The Neilgherry Plateau*.—This tract was surveyed and reported on in 1857-58, and was the first so treated. The report was published in 1859 in the first volume of the *Memoirs of the Geological Survey of India*. (3) *The Cretaceous Rocks of Trichinopoly, South Arcot and Pondicherry*.—The report on the cretaceous rocks of Trichinopoly and South Arcot districts and of the French territory around Pondicherry was published in 1863 as part I of Vol. IV of the *Memoirs of the Geological Survey of India*. This report described also the jurassic plant beds of Ootacoor, &c. (underlying the cretaceous basin in Trichinopoly district), and referred rather briefly to the older and newer formations adjoining the cretaceous rocks. The survey of these rocks was executed between 1857 (when the survey was first extended to this Presidency) and 1862. "The Cretaceous Fauna of Southern India" occupies four volumes of the *Paleontologia Indica*, published between 1863 and 1873. (4) *The Gneissic, Tertiary and Recent Rocks of Salem, Trichinopoly, South Arcot, and Tanjore*.—The cretaceous areas above described lie within the limits of sheet 79 of the Indian Atlas; which series of maps had been selected to form the basis of the geological maps. The country surrounding the cretaceous rocks was therefore next taken up in systematic extension of the work. The fluvial and marine alluvia, the greater part of the lateritic and Cuddalore formations, and a large tract of gneissic rocks in the Cauvery, were thus mapped in 1859-60. In 1861 and 1862 the area of sheet 79 was completed by mapping the gneissic rocks around Salem and the central and southern parts of South Arcot. The results of the survey of the extra cretaceous area of sheet 79 were published in 1864 in a memoir, "On the Geological Structure of parts of Salem, Trichinopoly, South Arcot, and Tanjore districts," which formed part 2 of Vol. IV of the *Memoirs, Geological Survey of India*. (5) *The Transition or Sub-metamorphic Rocks and the Lower Vindhyan of Cuddapah, Kurnool, Bellary, North Arcot, Nellore, and Kistna Districts*.—In 1861 fresh ground was broken by taking up for survey the transition or sub-metamorphic rocks in Cuddapah district, the "Diamond Sandstone" of Malcolmson. The extensions of these rocks were followed into North Arcot, Nellore, Bellary, Kurnool, and the Kistna districts in following seasons. Wide spreads of the surrounding gneissic country had to be examined in order not to overlook possible outliers (for instance) of the transition rocks, and thus were surveyed considerable tracts of the south-west of Cuddapah, the east of Bellary, and the centre of Nellore districts. Early in 1865 the country round Kurnool town and near the junction of the Kistna and Toongabudra rivers, as also much of the Coondair and Bhavanasay valleys, was surveyed. The Canbun talook and the eastern border of the Cuddapah basin, from latitude 15° north up to its north-east extremity, at Juggayapett, were surveyed in the seasons of 1865-66-67 and 68-69. The country around Juggayapett, in which coal was reported to exist, was very closely examined, but no coal could be found, a conclusion which was fully confirmed by the borings made by order of Government. The assumed coal-field had been visited, in 1863, by the Superintendent of the Geological Survey of India, but no indications were found of the existence of coal. The rocks of the Juggayapett country belong to the transition or sub-metamorphic series, and not to the much younger Gondwana system, the lower part of which forms the lowest horizon at which coal has been found in India. The greater part of the area occupied by the "Diamond Sandstones" of Malcolmson was surveyed resulting, or at least viewed, in the important memoir "On the Cuddapah and Kurnool Formations in the Madras Presidency," published in 1872 as part 1 of Vol. VIII of the *Memoirs, Geological Survey of India*. In this memoir the division of the "Diamond Sandstone" series into two distinct series, the "Cuddapah's" or Upper Transition and the "Kurnool's" Lower Vindhyan, was first adopted. The rocks belonging to these two series occupy tracts included in the atlas sheets, Nos. 58, 59, 75, 76, 77, and 78. (6) *The Chingleput District north of the Palaur*.—In the latter part of 1862 the examination of the Chingleput district (included in sheet 78) was commenced and the survey of so much of it as lies north of the Palaur river, together with adjoining parts of North Arcot, was completed in 1864; some obscure points being revised in 1865. The results were finally published in 1873 in a memoir "On the Geology of Madras," forming part 1 of Vol. X, *Memoirs, Geological Survey of India*. Some of the plant remains found in the Shreepermata division of the Upper Gondwana system were described and figured in part 4 of Vol. I of the "Fossil Flora of the Gondwana system" (*Paleontologia Indica*) in a monograph on the flora of the "Outliers on the Madras Coast." (7) *The Chingleput District south of the Palaur*.—In 1864 the part of Chingleput district lying south of the Palaur river and adjoining parts of North and South Arcot (so far as included in the south-east quarter of sheet 78) were geologically mapped. In 1865 was surveyed a considerable tract in the centre of North Arcot district closing up the work between the area last-mentioned and the western limit of the north-east quarter of sheet 78. For some unexplained reasons the officer who conducted this survey had not written his final reports on these tracts, nor on those surveyed by him in Cuddapah, Bellary and Nellore districts, when he was prematurely cut off by death in 1869. Though the maps and notes remain, it would be difficult for any one not having large personal acquaintance with the countries in question to draw up satisfactory memoirs on the data given by them. A sketch of the geology of North Arcot as far as surveyed was drawn up in 1879 (partly from the notes just mentioned) and published in the *Records, Geological Survey of India*, Vol. XII. (8) *The Coal-bearing Beds of Godavary Valley*.—In 1870-71, the Deputy Superintendent, Geological Survey of India, first connected the known rock formations of Central India with those established by the geological survey in the Madras Presidency, and gave much time and attention to superintending the borings for coal on and near the banks of the Godavary. On this occasion careful traverses of the country were carried from Sironcha down to the neighbourhood of Noosvedy in the Kistna district. In 1873 borings for coal were made in a patch of Barakar rocks (the true Indian carboniferous system) at Redadnole, 20 miles west of Rajahmundry. Unfortunately the

Aroot, Chingleput, Coimbatore, Godavery, Kistna, Malabar, the Neilgherry hills, the Pulney hills, Salem, the Shevaroy hills and Tinnevely, have attracted the most attention. They are frequent in upland tracts and where the situation is waste and rocky. Rock shrines consist of projecting rocks (called by Europeans tors) and rocking stones or large stones naturally poised (called by Europeans loggan stones); these being surrounded by double and single rings of rocks. Sometimes a large solitary rock is surrounded by a double circle of large stones, with two rocks on one side to form an entrance. These appear to have been sacrificial spots indicated merely by the presence of the rock. Groups of placed rocks are found similar in design to those of Carnac in Brittany. They are sometimes found alone, but sometimes also round a tumulus hereafter to be described. They are often placed in lines with singular exactness. These

coal seams found were of too poor a quality to be of any practical value. The reports on this coal exploration were published in several papers in the Records, Geological Survey of India, Vols. IV, V, and VII. (9) *Alleged Discoveries of Coal Rocks in Bellary and Cuddapah*.—In the autumn of 1870, the presence of coal rocks having been reported by the Superintendent of the School of Arts to have been discovered near Gooty and Cona Oopalpaud (Tadpatry talook) in Bellary district, and also near Cuddapah town, an official examination was made. A report disproving the assumed discoveries was published in Vol. IV of the Records, Geological Survey of India, 1871. (10) *The Singareny Coal-field*.—The discovery of the Singareny coal-field in the Nizam's territory in 1872, though not strictly belonging to the present list of work accomplished by the survey, promises to be of the highest value to the Madras Presidency, if the coal-field be connected by a direct railway with Bewdree, the centre of the great canal system of the Godavery and Kistna deltas and the eastern coast, and the starting point of the Bellary-Kistna Railway. By these the coal raised at Singareny can easily be distributed to Madras city and the South Indian Railway and to the Madras, Great Indian Peninsular, and South Mahratta Railways, as well as others yet to be constructed. (11) *The Rajahmundry, Visagapatam and Kistna Districts*.—In 1872-73 were surveyed the Rajahmundry district, the southern extremity of Visagapatam and the northern half of the Kistna district, the results being published in 1880 in the form of a memoir "On the Coastal Region of the Godavery," which forms part 3 of Vol. XVI of the Memoirs, Geological Survey of India. An instructive series of fossil plants found in the Upper Gondwana beds of Gollapully, near Ellore, is figured and described in part 4 ("Plants from Gollapully") of Vol. I of the Fossil Flora of the Gondwana system (Paleontologia Indica). (12) *The Wynaud Gold-field*.—In 1874-75 the Wynaud gold-field was surveyed and the report appeared in the Records, Geological Survey of India, Vol. VIII, 1876. Another report has also been published on the same tract after a second visit. (13) *North Nellore and South Kistna Districts*.—The survey of the northern part of Nellore district (north of lat. 15° N.) commenced in 1866, was resumed early in 1875, extended into the southern half of the Kistna district (excluding the Pulnaud) in 1876, and completed in 1877. The description of this coastal tract which is included in sheets 75, 76, 94 and 95 was published in 1879 in part 1 of Vol. XVI of the Memoirs, Geological Survey of India, with the title "Geology of the Eastern Coast from lat. 15° north to Masulipatam." Some of the very beautiful fossil plants from the Upper Gondwana beds of Vemavaram, near Ongole, are figured and described in a memoir on "The Outliers of the Madras," part 4 of Vol. I of the Fossil Flora of the Gondwana system (Paleontologia Indica). (14) *Central and South Nellore*.—In 1880 appeared a memoir "On the Geology of the Nellore portion of the Carnatic," forming part 2 of Vol. XVI of the Memoirs, Geological Survey of India. A memoir of the geology of the Prantheeta-Godavery valley (Memoirs, Geological Survey of India, Vol. XVIII, part 3) published in 1881 deals only incidentally with some of the formations belonging to the Madras Presidency, which are referred to in discussing rocks of similar age lying outside the Presidency. (15) *Revision of Cretaceous and Jurassic Beds in Trichinopoly*.—In September 1877, the cretaceous rocks in Trichinopoly district were re-visited and large collections of fossils were taken thence. The Jurassic Ootatoor plant beds were also re-examined for the purpose of comparison with the equivalent beds in the Madras and Ongole areas. Two short papers giving the results obtained appeared in the Records, Geological Survey of India, in 1878. (16) *South Tanjore and Trichinopoly, Poodocottah State and North Madura*.—In 1878 was taken up the survey of the southern parts of Tanjore and Trichinopoly districts of the north-eastern part of Madura and of the Poodocottah State (all within the limits of sheet 80). The report on this region was published in 1879 in the Records, Geological Survey of India, Vol. XII. (17) *Pondicherry Artesian Wells*.—In 1880 Pondicherry was officially visited for the purpose of inspecting the artesian borings made there by private enterprise. The reports expressed an opinion in favor of similar borings being tried in Madras and elsewhere along the coast alluvium. The reports, two in number, were published in Vol. XIII of the Records, Geological Survey of India. (18) *Central and South Travancore*.—In 1880-81 was surveyed a considerable part of Central and Southern Travancore, the Peermad hills being also visited at the request of the Travancore Government, that report might be made upon supposed auriferous veins in that quarter. The report on Travancore appeared in the Records, Vol. XVI, 1883. (19) *Madura and Tinnevely Districts*.—In 1880-81 work was resumed in Madura district and the survey was carried down into Tinnevely district and on to Cape Comorin. This work was continued in 1881-82 and 1882-83 when the survey of the eastern part of both districts was completed and the results published in 1884 in a memoir on the "Geology of Madura and Tinnevely Districts" forming part 1 of Vol. XX of the Memoirs, Geological Survey of India. (20) *South Travancore*.—The southern part of Travancore between Trivandrum and Cape Comorin was surveyed in 1882 and described in a report published in 1883 in Vol. XVI of the Records. (21) *Cave-exploration, Kurnool District*.—In the autumn of 1883 was taken up the exploration of the Billa Soorgam Bone Caves, in Kurnool district (first noticed by Captain Newbold in the Journal of the Asiatic Society of Bengal for 1844), when a considerable number of other caves previously unknown was discovered. These investigations still continue. The results of the cave-exploration have been recorded in two papers in the Records (Vol. XVII, parts 1 and 4, 1884). Some very good and interesting photographs of the Billa Soorgam and other caves in that part of the country have been secured. (22) *Nundigawh Talook, Kistna District*.—In January 1884 was surveyed a considerable portion of the Nundigawh talook, Kistna district, a description of which is included in the report on the country between the Singareny coal-field and the Kistna river published in Vol. XVIII of the Records—February 1885. (23) *Bellary and Anantapore Districts*.—The regular work of the geological survey now in progress is the examination of the great bands of schistose and granitoid gneiss traversing the Bellary and Anantapore districts. (24) *Miscellaneous*.—The above notes give the principal items of field-work accomplished, or still in progress, in the Madras Presidency, but the officers of the survey have rendered to Government directly, or indirectly, various other services. In the case of some of the longer memoirs above referred to, a précis of the information collected was published in the records very soon after the completion of the survey, to prevent the delay inevitable in the preparation of long reports and the accompanying maps and other illustrations. Special reports have been made to Government on specimens of coal, lignite and various metallic ores submitted for opinion. Correspondence has also been conducted with local officials, commercial firms and private individuals about iron ores, magnesite, corundum, gypsum Kaolin, chrome ores and other minerals of real or supposed value. Communications from Local Fund officials and others as to the feasibility of artesian borings, some in promising, others in impracticable, localities have been dealt with by the officers of the department. Public lectures on geology have been delivered at the Civil Engineering College. The mineral and rock collections and the paleontological collections at the Central Museum were arranged by officers of the department in 1883. The officers have also been frequent contributors of specimens to the Museum in various departments—petrological, mineralogical, paleontological, geological and ethnological.

structures would appear to indicate rude temples. Barrows are found in large or small groups. They consist of low tumuli or mounds, surrounded by single, double, and treble circles of large stones and rocks. The upper part of the tumulus contains nothing; but on digging deeper cists or sarcophagi formed of limestone slabs containing skeletons are met with, and around them urns of black and red pottery, with arms, arrow and spear heads, iron tripods, &c., are found. In some instances wrought copper and cast bronze belts have been discovered, with necklaces made of beads, portions of shells, and similar objects. It is remarkable also that an earth not belonging to the locality, red, sandy, or gray, has often been used to fill up these cairns. The cists lie at a depth of from eight to eighteen feet from the surface, and in some cases the space between the surface and the cists is found to contain evidences of human sacrifices, skeletons thrown in irregularly, skulls separate from the skeletons, and the like. These are evidently the earliest burial-grounds. Another class of barrows, which in outer appearance and construction precisely resemble those above described, contain, buried at greater or less depth, urns, large and small, with human ashes, pieces of bone, and charcoal. Archæologists have found no remains of arms or iron utensils in these last-named cairns. They appear to indicate a later stage of burial, on account of the evidence of cremation. Cairns are barrows made of stones piled together, in place of the ordinary heaps of earth. They abound on the hills of Southern India, especially in the parts which are now thickly populated. Some of these are more carefully constructed than others, and appear as far as can be seen to range through all degrees of antiquity. Dolmens (from the Celtic 'daul,' a table and 'maon,' a stone) consist of square or oblong erections of various sizes, composed of three or more large slabs of stone set upon their edges, and covered by a table-stone which is supported by them. They are closed or partially closed on three sides, and have one side entirely open. They contain no remains, and are probably memorial constructions or cenotaphs. Menhirs (from the Breton 'men' = stone, and 'hir' = high) are free-standing large stones. They are commemorative of particular spots. In Ganjam these are found as a substitute for cairns to mark places of burial. Cistvaens are constructed similarly to dolmens, but have four sides closed together, and when perfect they have a slab as cover. They are found sometimes isolated, but more usually buried under barrows. They are understood to have been used as depositories of the ashes of human beings after cremation. They contain these ashes, mixed with partly calcined human bones and pieces of broken pottery of a red or black colour. Some cistvaens have a round hole in one of the end slabs, from six to nine inches in diameter. This is a point of similarity with similar remains in Europe, Southern Russia, Circassia, &c. These remains are generally classed as prehistoric, but they are at any rate with certainty Dravidian. The Coorumar of the Carnatic still erect dolmens. The Todahs of the Neilgherry hills still make azhaurams or stone circles. Such remains are at present known to prevail mostly in Southern and part of Central India, but there is a singular resemblance between these and the same kind of remains in the northern latitudes of Europe. It is probable that they indicate methods of construction which are common to all races of men at a certain stage of development.[1] The

[1] SKETCH GENERAL ACCOUNT OF TUMULAR BURIAL PLACES.—*Introduction.*—These may be defined as burial-places in which the remains of the dead, either unburnt or burnt, are found, accompanied by other objects which have been buried simultaneously. The northern countries of Europe—Denmark, Sweden and Norway—are particularly full of such ancient burial-places; and they have received careful attention from the northern antiquaries, by whom they have been divided, according to their contents, into three classes:—Tumuli of the Stone period; Tumuli of the Bronze period; and Tumuli of the Iron period. Those of the Stone period are considered the oldest because neither bronze nor iron is found. Those of the Bronze period are considered next oldest, because iron is not found. The stone tumuli are often of great size, and are peculiarly distinguished by their important circles of stones and large stone chambers, in which are found the remains of unburnt bodies, together with objects of stone and amber. This period represents the lowest state of civilization; a state before the introduction of metals, when arms and implements consisted of spear-heads of flint and arrow-heads of flint or bone. The tumuli of the Bronze period contain relics of burnt bodies, vessels of clay and implements and ornaments of bronze; and so show the people in a more advanced state of civilization than the preceding. The tumuli of the Iron period show the people in a comparatively advanced state of civilization. Iron-swords, knives, and spear-heads, highly polished vessels, and trinkets of gold, silver, and precious stones are found in these, and some of them also contain sculptures and inscriptions. Besides the countries above mentioned, tumuli are found in Germany, France, Spain, Portugal, Great Britain, Siberia, America and India. In Europe tumuli belonging clearly to each of the three periods are common. In the south of India, investigation has not been sufficient to make a similar definition; and it cannot be said whether the tumuli do or do not go back to the earliest period. (2) *Tumular burial without cremation.*—This belongs to races quite beyond the reach of history. (3) *Tumular burial with cremation.*—The earliest accounts of tumular burial accompanied by cremation are given in the *Iliad*. The account of the funeral of Patroclus describes how the body was left burning during the night, and the embers were quenched with wine in the morning; how the ashes were inclosed in an urn, and placed near the centre of the place occupied by the pyre which was surrounded by an

names by which these remains are known to the natives in Southern India are very various. On the West Coast a special kind of menhir is found called by the natives topicull, hat stone; or kodeycull, umbrella stone. A more general term on the West Coast is nannanauticull meaning stone standing over a place where treasure is hid. A cairn is called by the Badagahs of the Neilgherries poccull or navel-stone; and a barrow is called by them poncooly or gold-pit. At Devanoor in the South Arcot district a large menhir in the middle of a number of dolmens is called cutcherry-cull or the stone of office. In the Chingleput district a tumulus goes by the name of Coorunbar-mode, or Coorunbar's mound. In the Telooogo country stone monuments are called racshasa goondloo or rocks of the giants, but this is a sanscritized term. The most prevalent term in Southern India is Pandicoozhy or pit of the Paundies. This is plainly associated with the name of the Pandya country, for which see the first foot-note in the present work, under the heading Mahabharat. Paundy is the oldest Tamul word for a Tamulian.

729. The archæological remains of Southern India usually styled historic fall under five principal classes:—architecture, sculpture, coins, inscriptions, and military works and records. The architecture is divided into the two great classes of Hindoo and Mahomedan, each widely distinct from the other. The Hindoo architecture may be sub-divided according to style into four classes; Carnatic, Chalookyan, Booddhist, and Jeina. A detailed description of each of these will be found under those titles in Volume III, and need not here be repeated. The Carnatic style, otherwise called the Dravidian, is practically the indigenous style of the Presidency; though the Chalookyan prevails in its most northern parts. The remains of the ancient Booddhist architecture are only found in the Godavery and Kistna districts, in the neighbourhood of the Kistna river. The remains of Jeina architecture are found all over the Presidency, and especially on the West Coast; but it is still only an occasional style. In Vol. II, App. XXXVIII, will be found a list of conjectural and approximate dates assigned to the principal Hindoo temples, &c., in the Presidency, according to the most recent researches. The Mahomedan architecture special to Southern India is also treated of in Volume III under that title. The three Dekhany styles are the Bahminy, the Beejapore, and the Golecondah. The Mysore style of the end of the eighteenth century has also been reckoned as a separate Mahomedan style. The sculpture of Southern India is almost necessarily limited to the Hindoos, as the Mahomedan religion forbids the representation of anything living, either man or animal. It is divided into the four classes of indigenous, Booddhist, Jain, and Brahminical, according to the religious beliefs which occasioned them. The indigenous sculptures consist of nagaculls or serpent figures, veeraculls or figures of heroes, and representations of village goddesses, demons, &c. The Booddhist sculptures consist of bas-reliefs and detached statues. The principal subjects of Booddhist sculptures are shown in Vol. II, App. XXXVII. The Jain sculptures are for the most part restricted to a representation of their twenty-four hierarchs whose names and distinctive symbols are shown in the same appendix. The Brahminical sculptures are nearly countless; see the list of the principal in the same appendix. Their subjects are generally forms of Brahma, Vishnoo, or Shiva; but others also are met with, more especially the figures of the larger animals, the lion, elephant, bull, and horse. The question of South Indian antiquarian coins is being treated by Messrs. Elliot and Thomas in the publication “*Numismata Orientalia*,” but it is not known when the work will be completed. They fall under the classes of Roman coins, brought to India after the conquest of Egypt by the Romans at the beginning of the Christian era; Arab coins from Egypt

artificial substructure; and how loose earth was then heaped above the whole so as to form a mound. Ezekiel (B.C. 587) predicting the fall of ‘Mesech and Tubal’ says ‘they are all gone down to hell with their weapons of war; and they have laid their swords under their heads.’ These were the inhabitants of the neighbourhood of the Caucasus mountains and the Black Sea, and probably the Scythians of Herodotus. Tacitus, in the first century, A.D., says of the Germans, that ‘the bodies of illustrious men were consumed with a particular kind of wood, but the funeral pile was neither strewed with costly garments nor enriched with fragrant spices. The arms of the deceased were committed to the flames and sometimes even his horse. A mound of earth was then raised to his memory, as a better sepulchre than those elaborate structures which, while they indicate the weakness of human vanity, are at best but a burden to the dead.’ (4) *Historical limit of tumular burial.*—Tumular burial disappeared before Hindooism, Judaism, Mahomedanism, and Christianity. The Aryan Hindoos (whether Brahmins, Booddhists, or Jains) first burn their dead; they then gather the ashes and throw them into a running stream, or in the case of distinguished persons they sometimes place them in an urn and bury them. But in no case is there any tumular burial. The Semitic races have from the earliest periods observed the custom of burying their dead unburnt and unmaimed. The same is the case with the Arabs. Christianity has continued the practice.

and Syria; Mahomedan Indian coins dating from the middle of the sixteenth century; and Hindoo coins not of great antiquity. A sketch history of Mahomedan and Hindoo coinages will be found in the article on Time, Money, Weights, and Measures. Inscriptions have been divided for all India into the following classes:—(1) early Booddhist, in Indian Pali, from B.C. 250 to 50, on pillars, rocks, and caves; (2) later Booddhist, in Indian Pali, from A.D. 0 to A.D. 400; (3) Indo-Scythian, in Aryan Pali, from B.C. 100 to A.D. 100, on stone slabs, copper-plates, and seals; (4) early Brahminical, in Sanscrit, from A.D. 100 to 600; (5) mediæval Brahminical, in Sanscrit, from A.D. 600 to 1193; (6) later Brahminical, in Sanscrit, from A.D. 1193 to 1750; (7) early Mahomedan, in Kufic and Arabic, from A.D. 1193 to 1451; (8) later Mahomedan, in Persian, from A.D. 1451 to 1750, on masjids and tombs of the Moghul emperors. The Asoca inscriptions at Jowgada in Ganjam illustrate the first class. The Amravatty tope has inscriptions under the second class. The copper-plates and stones of the Chalookya rajahs illustrate the fifth class. Those of the Vijianugger dynasty illustrate the sixth class. The list at foot [2] shows the principal old forts, Hindoo and Mahomedan, in the Presidency. The next foot-note [3] shows monuments of interest connected with British history in this Presidency.

[2] LIST OF THE PRINCIPAL SITES OF HINDOO

) MA

(FORTS (THE PRES

Ahtoor in Salem district.
 Amboordroog in North Arcot district.
 Arcot; Hindoo; now almost ruined.
 Ariancooppam near Pondicherry; Hindoo.
 Arnee in North Arcot; Hindoo; in ruins.
 Bellary; Hindoo, 16th century A.D.
 Bobbili in Vizagapatam district; Hindoo.
 Cancherry in Nellore district; Hindoo, 13th century A.D.; on a hill 1,500 feet above the sea.
 Cannanore in Malabar; Hindoo.
 Caruogooly in Chingleput district.
 Chetput in South Arcot district; Hindoo.
 Chetwye in Malabar; Dutch, A.D. 1717.
 Chingleput; Hindoo, 16th century A.D.
 Chundragherry in North Arcot; Hindoo, A.D. 1510.
 Cochin in Malabar; First European fort in India, Portuguese, A.D. 1503; now ruined and occupied by a lig
 Covelong in Chingleput district; Mahomedan, A.D. 1745; blown up in A.D. 1752 by Clive.
 Cuddalore in South Arcot; Mahomedan; in ruins.
 Devicottah in Tanjore, on the coast at the mouth of the Coleroon river; an early settlement of the East India Company; ruined.
 Dharaupooram in Coimbatore district; the fort dismantled in A.D. 1792.
 Dindigul in Madura district, on a rock, 1,223 feet high; Hindoo; was occupied by the British until A.D. 1800; is of great natural strength.

Fort St. David in South Arcot, 17th century A.D.; parts are in good preservation; it is a landmark for mariners.
 Fort St. George; British, A.D. 1639.
 Ganjam; East India Company's Fort, A.D. 1768.
 Goorramecondah in Cuddapah; Hindoo.
 Gooty in Bellary district; Mahratta, 18th century A.D.
 Gundicote in Cuddapah district, 1,670 feet high; Hindoo, A.D. 1589.
 Jinjee in South Arcot; Hindoo, A.D. 1442; there are several fine buildings in the fort.
 Palghaut in Malabar; Hindoo.
 Penecocondah in Bellary district; Hindoo; afterwards occupied by Mahomedans, who left many buildings.
 Permacoil in South Arcot; Hindoo; on a hill 370 feet high.
 Royadroog in Bellary district; Hindoo.
 Sattimungalam in Coimbatore district; Hindoo.
 Tanjore; Hindoo; occupied by the Mahrattas.
 Tellicherry in Malabar; Hindoo; used as a jail.
 Tranquebar in Tanjore, built by the Danes, A.D. 1624.
 Trivandrum in Travancore; Hindoo; full of quaint wooden buildings.
 Tyaugadroog; South Arcot; old Hindoo.
 Vellore; North Arcot; Hindoo, 1500.
 Vinoocondah in the Kistna district; old Hindoo.

[3] PUBLIC MONUMENTS CONNECTED WITH BRITISH HISTORY.

Bronze statue of General Neill, 1st Madras Fusiliers, in the Mount Road, Madras.
 Statue of Schwartz by Flaxman in the church at the little fort, Tanjore.
 Tower on the coast at Shalwanaiakanputnam in Tanjore district, erected by the late Rajah of Tanjore to commemorate the battle of Waterloo.
 Monument on the Red Hills, west of Pondicherry, to Major Stevens, Chief Engineer, killed in the trenches during the siege of Pondicherry, 1778.
 Obelisk at Cottacooppam, north of Pondicherry, over graves of soldiers killed at the siege of Pondicherry, 1760.
 Cenotaph at Tricalore to the memory of Arthur French, M.C.S., who died at Cuddalore in 1823.
 Monuments to officers who fell or died of wounds received at Pauchaulamcooreby, 1799-81, at Vellaaram, Tinnevely district.
 Bronze equestrian statue of Sir Thomas Munro, in the Mount Road, Madras.
 On the parade-ground facing the Council House at Madras, stone canopy covering a large pedestrian marble statue of the Marquis of Cornwallis on a marble pedestal, decorated with groups of figures in alto-relievo, representing the surrender of the sons and suite of Tippoo Sultan.
 Monument at Patticoondah built in memory of Sir Thomas Munro, erected on the spot where he died of cholera.
 White marble statue of Sir Thomas Munro in the Fort Church, Madras.
 Cenotaph to the Marquis of Cornwallis, enclosed by an iron railing cast from the cannon taken at the siege of Seringapatam, 1799, by the troops under his command; opposite the High Court, Madras.
 Cenotaph to Colonel Dalrymple on the Parade-ground, St. Thomas' Mount.
 Obelisk in memory of General Sydenham at St. Thomas' Mount.
 Granite column to Colonel Noble, erected by the men of the Horse Artillery at St. Thomas' Mount.
 A half-length marble bust by Chantrey to Colonel Noble, placed by the officers, Royal Horse Artillery, in the Church, St. Thomas' Mount.
 Madras Memorial Hall, erected by public subscription in memory of the Madras Presidency not joining in the Sepoy Mutiny of 1857.
 Monuments to Colonel Brown and Captain Hislop, killed in the battle of Poolalore, Conjeeveram, 1781.
 Monument on the Race-course, Guindy, to the memory of Major Donald Mackay, who died in 1783.
 Cyclone monument in the Fort at Masulipatam to the memory of those who perished in 1864.

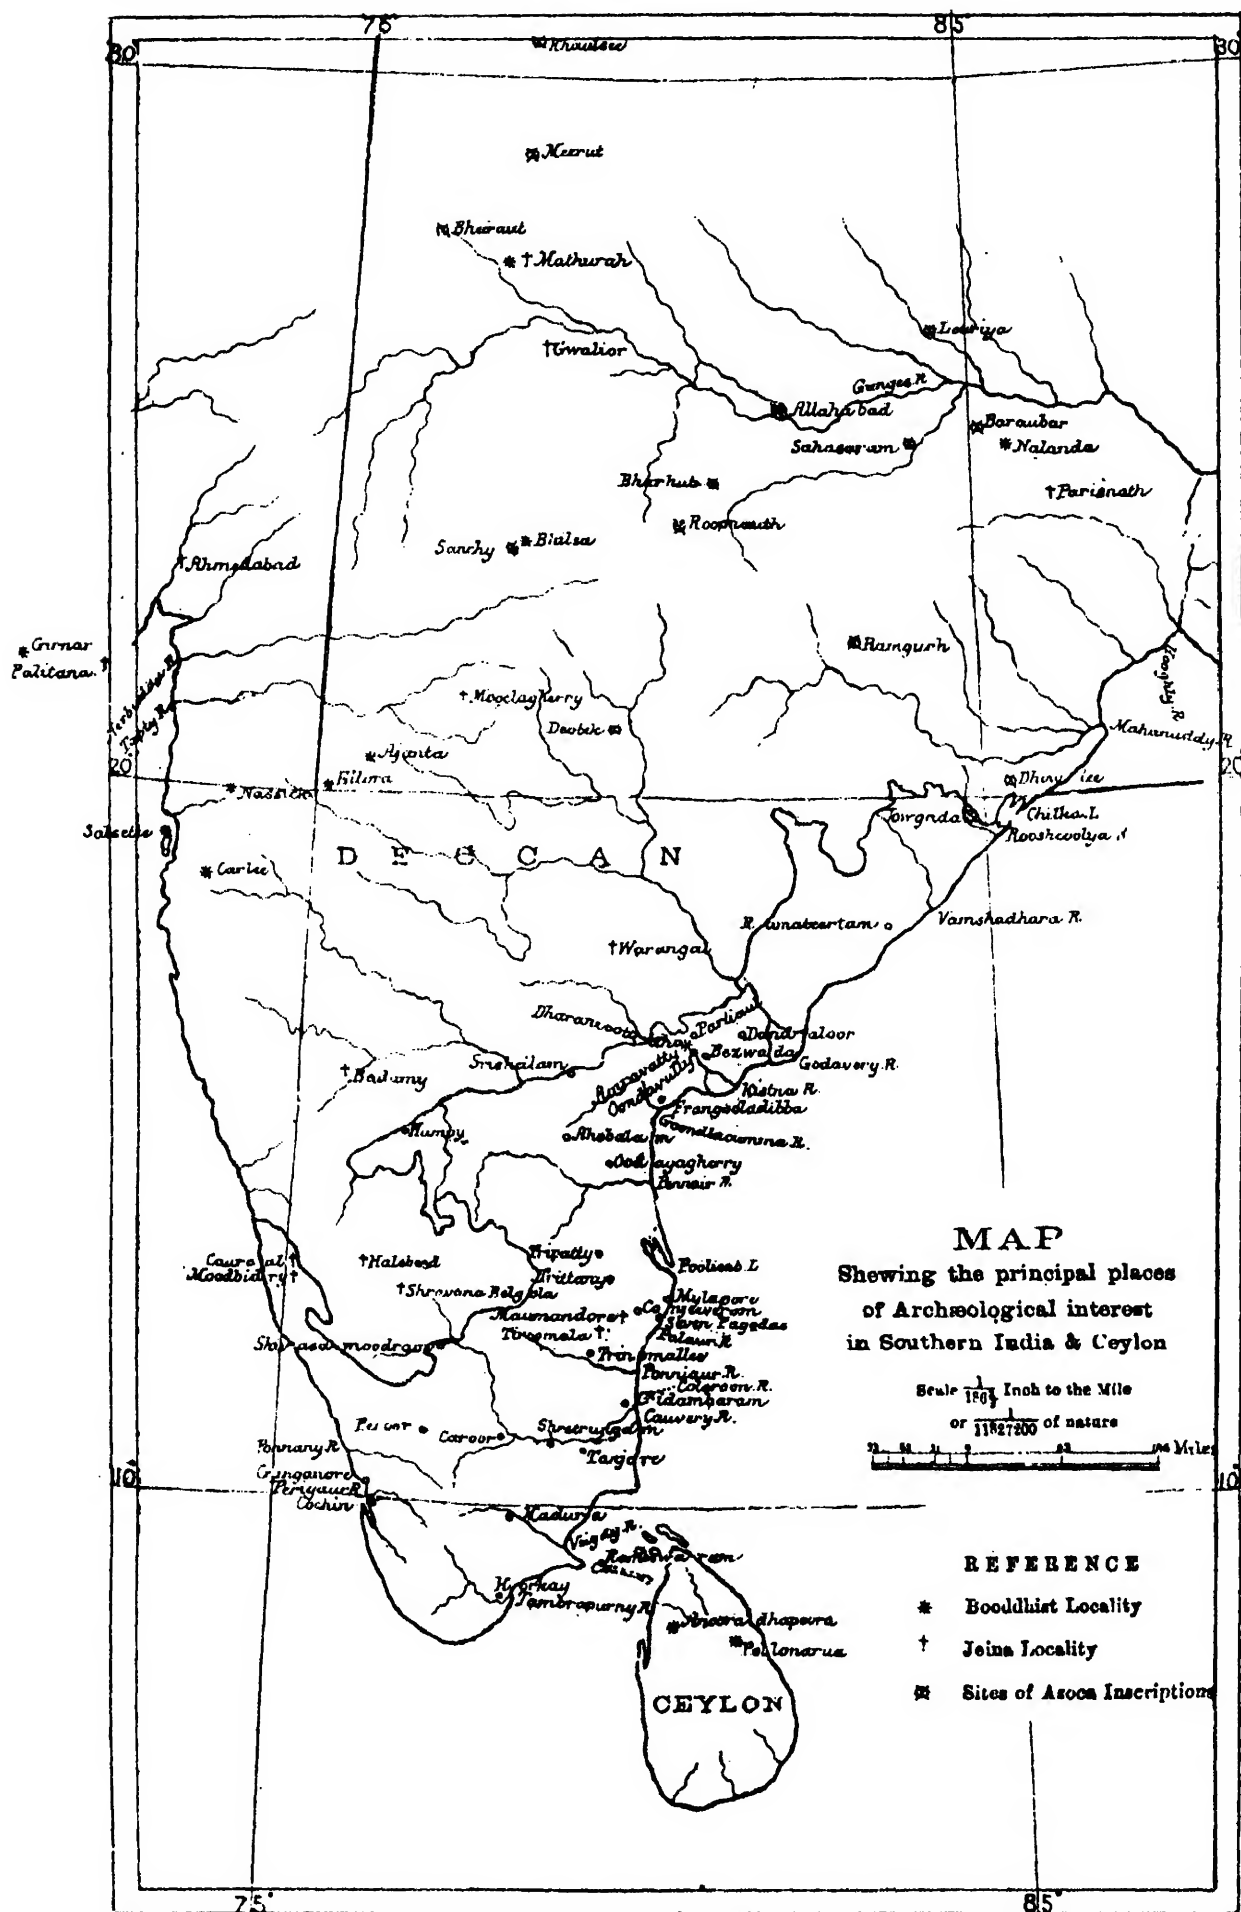

730. The general archæological topography of the Presidency is shown in tabular form by districts in the foot-note.[4] Reference may also be made to the

[4] LIST OF THE PRINCIPAL OBJECTS OF ARCHÆOLOGICAL INTEREST IN THE PRESIDENCY, ARRANGED BY DISTRICTS.

District.	Talook.	Village.	Name or description of object.
Anantapore .. Arcot, North..	Tadpatry	Tadpatry	Two great gopoorams of a deserted temple. Several rock-cut Jaina memorials. Dolmens, stone-circles, &c.
	Throughout Goodiynttam and Chittoor Pulmannair Chundragheri	Chundragheri	Small dolmens by modern Coorambar. (1) Rajah Mahaul or Rajah's palace. Built by the Teloo-goo kings. Rajah Shreerungaroy of that dynasty is said to have signed the treaty granting the settlement of Madras to the English in the centre room in 1639. The mahaul is unique for strength and peculiarity of architecture; built almost entirely of granite, no wood being employed. (2) Rance Mahaul, a smaller building adjoining. Formerly a Jaina centre. A Jain figure here 16½ feet high.
	Chundragheri	Tiroomullay Upper Tripatty	Sacred hill and great temple, changed by Ramanooja from worship of Shiva to that of Vishnoo.
	Carve Velloi	ver Tripatty tany ...	Temples. Ancient temple with inscriptions. Temple. The marriage mantapam is noteworthy. The Delhi gato. Ancient seat of the Carnatic family. Citadel defended by Clive.
	Do.	Manmandore Cuddalore	Jaina rock-cut caves. (1) The garden house. Built about 1738. Was more than once captured by the French. During the period from 1746 to 1752, when Fort St. David was the chief settlement on the Coromandel Coast, this building is said to have been the Governor's residence. (2) At Fort St. David some remains of the subterraneous gallery which ran round the fort under the glacis and of the mines leading off from it were not long ago discovered and opened up. (3) An obelisk to the memory of Major Stevens, killed at the siege of Pondicherry in 1778. (4) Some old tombs in an ancient grave-yard at Cuddalore. (5) An old grave-yard near Fort St. David.
	Do.	Jinjee	Fortress on three hills. Stormed by the French, and pillars taken to Pondicherry.
	Do.	Permacoil ...	Fort contested by French and English.
	Cullacoorchy	Tyangadroog ...	Fort built by the French.
	Trinon Chidun	Chidambaram	Mahomedan Fort. Fire lingam. One of the five great lingams of India. Air lingam, invisible.
	Hoovit budgally Hospet Do.	Maugalam ... Vijianugger in th limits of Caualan pooram.	Temple of Vengopaulasawmy remarkably sculptured. Temple of Anantasawmy of peculiar construction. Temple of Pattabhirama. Temple of Coombhara. Mattam of Chandrashekhar. Rock-cut room or hall. Temple of Yel-lamina. A tower, the top of which is in the shape of a lotus. Another tower (dark). Palace with spiral steps. Ancul-mantapam, or elephant stables. Nowbutkhana. The gymnasia of Atchoota Row. Agasagitty Mahaul, or Washerman's Palace. Temple of Hazara Ramechendra. Nelamaney, i.e., a house in the ground. Wocalihonda or Bath. Bheemani-baugaloo, or Bheema's gate. Gaunagitty (or oilmangers') Temple. Oogmnarasimha's temple. Krishnapooram temple. Woca-lihonda temple.
Bellary	Do.	Do. in the limits of Humpty.	Sausivecal Benakappa. Mantapam of Hemacoota. Cudlecaul Benakappa. Mantapam of Nija Linga. Manmata Mattam. Temple of Yedura Basappa.
	Do.	Do. in the limits of Vencatapooram.	Mantanga hill. Bazaar and temple of Atchootapooram. Temple of Rungasawmy. Temple of Rama. Varauha temple. Manly-nunda Ragoonathasawmy. Temple of Goddada Simhappa.
	Do.	Nimbaupooram	Remarkable mound of calcareous scoria.
	Do.	Nagaulls and Veeraculla.
	Do.	Caurcal ...	Jaina monolithic statue, 42 feet high. Only two similar exist, one next mentioned, and one at Shrauvana Belgola, in Mysore.
	Do.	Yenoor ..	Jaina statue, 35 feet high.
	Do.	Moodbidry ...	Jaina temples. Style, stone imitating wood.
	Do.	St. Thomas' Mount.	Stone monuments.
	Do.	Pallavaram ...	Church erected over traditionary site of St. Thomas's martyrdom.
	Do.	Mauvellipooram ...	Stone cross in the church.
Canara, South.	Throughout Oodipy	Hill called by the Brahmins after the five Pandavas. Called Seven Pagodas. This great Dravidian work was executed by the Pallavas. See Vol. III.
	Do.	Conjeeveram ...	The seat of the Pallava Dynasty. Great Shiva temple, &c. See Vol. III.
	Do.	St. Thomas' Mount.	Stone monuments. Roman coins.
	Do.	Pallavaram ...	Ruins of an ancient city.
	Do.	Mauvellipooram ...	Carved temple.
	Do.	Caroor ...	Ancient temples said to have been built by Chola kings.
	Do.
	Do.
	Do.
	Do.

	Do.	Mauvellipooram ...	Carved temple.
	Do.	Caroor ...	Ancient temples said to have been built by Chola kings.
	Do.

different district notices in Vol. II, App. XII. The Jowgada inscription, Buddhist Amravatty tope, stone monuments at Mauvellipooram, and ruins of the Hindoo

District.	Talook.	Village.	Name or description of object.
Cochin	Cochin ...	Old church, once a cathedral. Tomb of Vasco da Gama. Ruins of Albuquerque's fortifications. Jewish synagogue, and clock 200 years old.
		Cranganore ...	An early settlement of the Jews. Shunkaracharya born here.
		Putticau ...	Several temples and dolmens.
		Tiroccore ...	Temple in a cave.
		Tiroovilvamullay ...	Temple and rock-cut caves.
		Triashoova Peroor ...	Temple.
		Caccaud ...	Rock-cut cave.
Cuddapah ...	Throughout	Fort of Poligars.
	Voilpaud ...	Goorramcondah ...	Old palace with upstairs.
	Madanapully ...	Sompully ...	Pagoda. Carved monolith in front with carvings. Fresco paintings.
	Cuddapah ...	Cuddapah ...	Four buildings formerly occupied as palaces of the Nawab of Cuddapah.
	Jummalmudoo-goo.	Gundicote Hill ...	Two temples constructed about 700 years ago, and one mosque built about 400 years.
Ganjam ...	Throughout	Brahminical and Mahomedan remains. Menhirs erected by modern Sowrahs.
	Chicacole ...	Chicacole ...	First capital of the old Calinga Kingdom. Large mosque here, 200 years old and more.
	Do. ...	Calingapatam ...	Another capital of Calinga. Large mosque.
	Do. ...	Poorooshattaporo ...	Stone-cut goddess.
	Mundasa Zemindarry.	Mahendragherry Mount.	Four temples on the summit.
Godavery ...	Berhampore ...	Jowgada ...	Rock engravings exhibiting the Asoca tablet.
	Bhadrachellam and Rekapully.	Stone monuments and circles.
	Ramchन्द्रa-pooram.	Drauksharamam ...	Large temple.
	Ellore ...	Dendalore ...	Formerly part of the city of Vaigy, capital of the old Vengy Kingdom.
Kistna ...	Narsapore ...	Madapollam ...	Fort. The chintzes of trade called after this place.
	Goontoor ...	Oondavully ...	Four-storeyed rock-cut temple, made by Chalookyas. Colossal statue of Vishnoo in the third storey.
	Sattenapully ...	Amravatty ...	Remains of the great Buddhist tope. See Vol. III.
	Pulnaud ...	Pidoogooraula ...	The mound.
	Goodivanda ...	Goodivanda ...	A colossal figure of Buddha in the enclosure of a choultry.
	Bezvada ...	Bezvada ...	Religious centre of the ancient Vengy kingdom. Buddhist image (stone and copper) in the library.
	Vinoocondah ...	Vinoocondah ...	A celebrated mountapam.
	Narsarowpet ...	Condaveed ...	The fort.
	Bezvada ...	Condapilly ...	Do.
	Sattenapully ...	Bellamcondah ...	Do.
	Nundigauma ...	Ramireddipully Hill.	A remarkable carved stone.
	Partiaul ...	Site of Golcondah diamond mines.
Kurnool ...	Throughout	Poligar forts. Inscriptions.
	Sirwail ...	Ahobalam ...	Ancient temples.
	Nundicotore ...	Srisheilam ...	Great temple on the Kistna river, surrounded by many minor temples.
Madura ...	Collicoontla ...	Owk ...	Formerly the seat of a local line of powerful Hindoo chiefs.
	Madura ...	Madura ...	Great Shiva temple. Trimal Naick's palace. Tamkani Bungalow, said to have been built by the ancient kings as a stand whence to witness the fights of wild beasts.
	Pulney ...	Pulney Hills ...	Dolmens.
	Ramnaud Zemindarry.	Rameswarum ...	Temple, object of pilgrimage to Hindoos throughout India. Specimen of the best Dravidian style.
Malabar ...	Throughout	Dolmens. Rock-cut sculptures.
Neigherries ...	Throughout	Cairns, barrows, cistvaens, cromlechs.
Nellore ...	Oodayagherry ...	Oodayagherry ...	Hill-fort.
Salem ...	Throughout	Stone monuments.
	Namculi	Embankment on the side of the Caroovaltaur river.
	Salom ...	Shevaroy Hills ...	Cairns and cromlechs.
Tanjore ...	Throughout	Temples and Jaina remains.
	Tanjore ...	Tanjore ...	Ancient temple. The only large Dravidian temple known to be built on a pre-designed plan throughout. Palace of the late Rajah.
	Negapatam ...	Negapatam ...	Temples.
	Combaconam ...	Combaconam ...	Temples.
Tinnevely ...	Throughout	Nagaculla. Veeraculla. Old coins.
	Ambasamoodram ...	Shermadevy ...	Sepulchral urns.
	Tencaray ...	Aditchanalloor ...	Do.
	Do. ...	Nullamullay ...	Do.
	Tencaray ...	Courtallam ...	Do.
	Tencaray ...	Korkay ...	The <i>adyas</i> of the Greeks. First known seat of the old Dravidian dynasties. Receded inland and superseded by Cauyal. It by Tuticorin.
Trichinopoly ...	Ottapidauram ...	Caloogoomullay ...	Rock-cut temple and Jaina inscriptions.
	Trichinopoly ...	Trichinopoly ...	Nawab's palace. Main Guard gate.
	Oodayarpolliam ...	Gungaycundapooram ...	Old temple.
	Trichinopoly ...	Shreerungam ...	The great Vishnoo temple.
Visagapatam.	Visagapatam ...	Visagapatam ...	Durgah on the hill.

Vijianugger city, are perhaps of the most salient interest for different reasons. Southern India is filled with temples in the Dravidian style. Volume III contains a detailed notice of a considerable number of the sites of these antiquities. The accompanying map indicates roughly the sites of particular archaeological interest in Southern India.

731. NATURE OF GOVERNMENT OPERATIONS.—The Government have for the last four years employed an Archæological Surveyor.^[5] The officer who at present holds the appointment is employed conjointly by the Bombay Government, the establishment under him being however separate. Three volumes of the Archæological Survey of Southern India have been published. The first volume contains a list of the antiquities to be found in the different villages and towns of the Presidency arranged by districts. The second volume contains lists of stone and copper-plate inscriptions first chronologically and then dynastically arranged; with a historical sketch of the different ancient Hindoo and Mahomedan dynasties. The third volume contains a detailed account of different marbles taken from the Amravatty stoope. A certain number of objects of antiquarian interest are specially in charge of the Revenue or Public Works Departments. There are also very numerous public monuments, buildings, including all pagodas and mosques, still used as places of worship, which are in the hands of private individuals or corporations. A scheme for the conservation of the latter is under consideration. Section 23 of India Act XX of 1863 (the Religious Endowments Act) provides that nothing in that Act is to prevent the Government using their power otherwise given them by Regulation for taking steps to prevent injury to buildings remarkable for their antiquity, or for their historical or architectural value.

ARCHITECTURE.

732. INTRODUCTION.—The indigenous styles of Hindoo and Mahomedan architecture being matters mainly of antiquarian interest are treated under Archæology. The Mahomedan styles of Ahmedabad, Beejapore, &c., the Hindoo style of the Carnatic, the English Gothic style, and the Italian Renaissance style have each been introduced by the Engineers of the Public Works Department with modifications to suit modern local requirements of arrangement and economy. In the style of the Government civil buildings of the past century, the Italian element must be said to predominate; and the whole, though not equal to the traditional native styles as regards suitability to the climate and to oriental scenery, is nevertheless distinguished for lightness and elegance.

733. GOVERNMENT ARCHITECT.—With a view to the improvement of architectural and structural designs in the buildings of the Public Works Department, the Madras Government have now for fifteen years entertained at head-quarters a Consulting Architect similar to those entertained in Calcutta and Bombay, to whom all projects for important buildings are sent, and from whom designs for various purposes are called for. In nearly all cases the design merely is called for, and the execution is handed over to the Public Works Department, subject to general superintendence by the Consulting Architect. Some works at the Presidency town however are put under the direct charge of the Architect, who then executes them with Public Works subordinate agency. The following points have always been kept in view by the Madras Consulting Architect; the capabilities of the various

[⁵] **SKETCH HISTORY OF GOVERNMENT OPERATIONS.**—An archæological survey of India was formally begun under General Cunningham in 1871. In 1873 Dr. Burgess was appointed Archæological Surveyor of Western India, including the Bombay Presidency, Soinde, together with the southern half of Rajpootana, Malwah, the Berars, part of the Central Provinces and Hyderabad. In 1879 the Secretary of State proposed arrangements for an archæological survey of Madras, and the matter was taken up by the Government, who decided to place it under Dr. Burgess without prejudice to his duties under other Governments. As a preliminary to this survey however Mr. R. Sewell of the Madras Civil Service was put on special duty from January 1881, to collect and arrange as complete lists as possible of all the antiquarian remains in the Presidency. Mr. Sewell's special duty continued till April 1883. Dr. Burgess took up his appointment as Archæological Surveyor in November 1881. The work in 1881-82 consisted chiefly in a visit to the Buddhist stoope or tope at Amravatty in the Kistna district, which had shortly before been excavated by orders of Government, and the transfer thence of a large number of the most characteristic sculptures to the Central Museum at Madras. A number of Amravatty marbles were found at Bezwada. The work in 1882-83 was miscellaneous. The survey of the ancient buildings at Hampy or Vijianugger in the Bellary district was begun in October 1883, and is now in progress.

materials peculiar to the country, the development of ideas and forms suitable to the climate and situation, and the suppression of ornament which does not simultaneously serve a useful end. The introduction of European taste is avoided, with the two-fold object of developing arts indigenous to the country, and of dispensing with European ornamental materials difficult to import or imitate. Attempts are at present being made to erect buildings in which exterior stucco is absent; and brick, stone, and other durable materials are employed in their natural and unconcealed state. A Government brickfield is conducted by the Consulting Architect, in which superior bricks, tiles, pavements, stained glass, and terracotta are manufactured. Among the more important buildings designed by the Government Architect during the past few years at Madras are the Presidency College, the Senate House, the Revenue Board buildings, the Central Railway Station, the Lying-in Hospital, the Chepauk Public Works Offices and the Postal and Telegraph Office. In the provinces the Combaconam College, the Napier Museum at Trivandrum, the Lawrence Asylum at Ootacamund and several churches have been built. Among the works of restoration and adaptation are Trimal Naick's palace at Madura, the old palace at Trichinopoly, and the new palace at Royapettah, Madras. With the exception of the Presidency College, the Lying-in Hospital, the Chepauk Public Works Offices at Madras, and the Lawrence Asylum, Ootacamund, the whole of these buildings have been constructed in quasi-oriental styles, with similar ornamentation.

SCHOOL OF ARTS.

734. DESCRIPTION OF THE INSTITUTION.—The school [1] is divided into two branches, an Industrial School and a Drawing and Painting Academy, the latter being only lately instituted. In the Industrial School all students pass a course of freehand and model-drawing and then proceed to special work, for instance, goldsmith's work, wood-carving, pottery, wood and copperplate engraving, etching, modelling, glass-painting, house-decoration, &c. There are scholarships varying from 5 to 15 rupees per mensem. The aim of this branch is by the use of good examples of Indian art to endeavour to some extent to counteract the injurious influence which the large importations of European manufactures of the worst possible design have had on the native handicrafts, and also to train students for engraving and other useful occupations. The school is at present under great disadvantages owing to the want of good examples of Indian work to set before the students. Casts of good Indian wood and stone carving, examples of goldsmith's work, printed cottons, photographs to a large scale of wall decoration and architectural detail, &c., are the articles most needed. In the pottery connected with this branch, besides ornamental ware and terracotta work for public buildings and stained glass windows, large quantities of insulators and porous cells for the Telegraph department, bread-pans for the Commissariat, gallipots for the Medical department, and works of a similar kind, such as roofing and flooring tiles, &c., are made. They are of good manufacture and can be profitably sold at prices much below imported articles. It has been proposed to form this section into a separate establishment. In the Drawing and Painting Academy the course of instruction is similar to that adopted at South Kensington. It includes elementary and advanced drawing and painting, modelling, &c., and painting and modelling from life. The fees are considerably higher than in the Industrial School. There were 147 pupils on the rolls at the close of the year 1883-84.

[1] SKETCH HISTORY OF THE SCHOOL OF ARTS.—The School of Industrial Arts was established privately by Dr. Hunter in 1850, and was supported till 1855 by fees from pupils, by payments for drawings, engravings, and other work turned out in the school, and by small contributions from the public. In 1855 the school was taken up by Government, and a committee, in communication with Dr. Hunter, laid down rules and a course of instruction. Owing to the difficulty of finding at the same time competent technical instructors and a suitable class of students, the method of the school has somewhat fallen away from the intentions of Government as then expressed. Of late however the institution has engaged particular attention and efforts are being made to extend its usefulness. It is understood that the Madras school has been adopted as a model in Calcutta and Bombay. The institution has till quite recently and for a long period been under the charge of Mr. R. F. Chisholm.

MADRAS MUSEUM.

735. DESCRIPTION.—The Madras Government Central Museum, still so called though there are at present no others,^[1] has for its chief object to encourage a taste for, and afford means for popular instruction in Indian Geology, Botany, and Zoology. It is also intended to develop the resources of the country by exhibiting raw products, to provide facilities for the scientific teacher or student of natural history or forestry, and to illustrate the ethnology and archæology of the Presidency and the manners and customs of its aboriginal inhabitants. The Museum possesses two well appointed libraries open to the public daily, one scientific, and one general. The museum itself is divided into the following rooms or sections:—‘Geology,’ including Mineralogy and Economical and district Geology; ‘Botany,’ practical, systematic and morphological; ‘Zoology,’ including a room devoted to mammals and birds, a room devoted to fish and reptiles, a room devoted to mollusca, crustacea, some of the lower forms of the animal kingdom and osteology, and a collection of insects; ‘Raw Products and Manufactures,’ vegetable and animal (including timbers and forest products); ‘Machinery and models of tools, &c.’; ‘Ethnology and Antiquities;’ and ‘Numismatology.’ The Museum is open to the public every week-day ‘free of charge,’ and a special arrangement exists for the admission of ‘gosha’ women. In the list given below ^[2] is shewn the catalogues and other publications published in connection with the Museum, and in the

[1] SKETCH HISTORY OF MUSEUMS IN THE PRESIDENCY.—The efforts of Government to establish Museums in this Presidency commenced, under authority of the Court of Directors, in 1851. In that year the Madras Literary Society presented to Government a collection of geological specimens, and this, with the duplicates left after despatching the articles for the Great Exhibition in Hyde Park, London, formed the nucleus of what is now the Government Central Museum. Subsequently in 1855 subordinate Museums were established at Bellary, Cuddalore, Mangalore, Rajahmundry, and Ootacamund, partly for local purposes and partly with the object of serving as feeders for the Central Museum at Madras. These were not successful principally for want of competent agency, and with the exception of the one at Rajahmundry they were closed in June 1861. In 1862 many of the articles collected in the up-country museums were transferred to Madras. In the case of Ootacamund the allowance of Rupees 100 per mensem withdrawn from the Museum was transferred to the Public Library there, and so continued till 1876, in which year both it and the grant for the Rajahmundry Museum were discontinued. In 1855 the formation of a Zoological Garden in connection with the Central Museum was sanctioned, and the animals were retained there till 1863, when they were transferred to the Madras Peoples’ Park. The Government continued to meet the cost of feeding the collection till the close of 1875, when it became a Municipal charge.

next list [3] the various popular lectures delivered. In the following table [4] is shown the number of annual visitors for the last 11 years.

GOVERNMENT IN CONNECTION WITH LITERATURE.

736. PUBLICATIONS.—Such of the Government Secretariat publications or records as appear likely to interest the public, and all annual reports, are offered to the public for sale. The sale depôt is at present the Government Press at Fort St. George in Madras. These publications are advertised in a supplement to the Gazette, and attention is drawn from time to time to the list published in the Gazette by a brief advertisement in the local newspapers. At foot is given a list of the more important of these now for sale, with the prices attached.^[1] A few

[1] LIST OF PRINCIPAL GOVERNMENT SECRETARIAT RECORDS FOR SALE AT THE GOVERNMENT PRESS.

Abkarry System of the Madras Presidency—Report on the --, by R. A. Dalsell. Price, Rupees 2.

Abkarry System--Second Report on the—, by R. A. Dalzell. Price, Annas 16.

Acts of the Government of India. At nearly cost price.

Acts of the Government of Madras. At nearly cost price.

Administration Report of the Irrigation Branch for the year 1880-81, price, Rupees 1-4; for 1881-82, price, Rupees 1-4; for 1882-83, with maps, price, Rupees 6.

of these belong to the series called "Selections from the Records" which is catalogued in Vol. II, App. LXXXV. The Government also make occasional official book publications. Among these are the District Manuals, or hand-books illustrative of the permanent characteristics of the different revenue districts. A series of manuals was projected for the Madras Presidency in 1862, detailed steps were taken in 1865, and the first manual that appeared was that of Mr. D. F. Carmichael for Vizagapatam, in 1868. Mr. Nelson's Madura Manual, which appeared in 1869, was the second of the series, and showed much original labour and research on

- Annual Administration Report of Forest Department for 1881-82, price, Annas 8; for 1882-83, price, Rupees 1-8 per copy.
- Annual Administration Report of Madras Presidency for 1874-75, 1875-76, 1876-77, 1877-78, 1878-79, 1879-80, 1880-81, 1881-82. Each—Price, Rupees 5; for 1882-83, price, Rupees 8.
- Australian Trees on the Neilgherries—Report on Measurements of the Growth of—. Price, Annas 8.
- Board's Standing Orders—Addenda and Corrigenda to the—for 1878 and 1879, price, Annas 4; for 1880-81, 1882 and 1883, price, Annas 4 each.
- Buckingham Canal—Narratives with Maps of the Kurnool canal (together with G.O. No. 371, dated 16th January 1881) and Madras Water-supply Project and—(bound in marble). Price, Rupees 4-12.
- Capital and Revenue Accounts—File of works for which—are kept other than Productive Public Works. Price, Rupees 4-4.
- Casuarina in the Nellore District—Report on the Measurement of Rates of Growth of—. Price, Annas 8 a copy.
- Census of the Madras Presidency, 1871,—Report on the—, by Surgeon-Major W. R. Cornish, F.R.C.S. In two volumes. Price, Rupees 10.
- Census of the Madras Presidency, 1881, by G. Stokes and Lewis McIver. In five volumes. Price, Rupees 15.
- Chemico-legal Examinations in Telooquo. Price, Annas 2.
- Cinchona Plantations—Report on the Government—, by Dr. Trimeu. Price, Annas 2.
- Cinchona Succirubra or Red Bark Tree—Report on the expedition to procure seeds and plants of the—. Price, Rupees 3.
- Civil Account Code, vol. 1.—The first, second, third, fourth and fifth lists of corrections to the—. Price each Annas 2.
- Civil Dispensaries—Report on— for 1874-75, price, 1 Rupee 4 Annas; for 1877, 1878, 1879, 1880, 1881 and 1882. Each—Price, Rupees 2.
- Code of Regulations for the Public Works Department, with forms, &c. Price, Rupees 6-8 a copy.
- Cotton Gins, &c.—Report on—, by Dr. F. Watson, vols. I and II. Price, Rupees 5.
- Court of Small Causes—Report on— for 1878, 1879, 1880, 1881, 1882 and 1883. Each—Price, Annas 8.
- Disturbances in Parlakimedy, Vizagapatam, and Goomsoor in 1832-36—Report on—. In two volumes. Price, Rupees 5.
- Excise Administration Reports for fustias 1286, 1287, 1289, and for nine months ending 31st March 1882, price, Annas 12 each; for fusly 1288, price, Rupee 1.
- Fibres of Southern India—Report on the—, No. 23. Price, Rupees 3.
- Forest Department Annual Administration Report for 1881-82, price, 8 Annas; for 1882-83, price, Rupees 1-8 per copy.
- Gold Mines—Report on—. Price, Rupee 1.
- Gurgun Oil and other Remedies—Report on the treatment of leprosy with—Selection No. 52. Price, Annas 8.
- Irrigation Branch Administration Report for the year 1880-81, price, Rupees 1-4; for 1881-82, price, Rupees 1-4; for 1882-83, with maps, price, Rupees 6.
- Jeypore—a collection and précis of papers about—. Price, Rupees 1-8.
- Jails, Madras—Rules for the management and superintendence of—. Price, Rupees 3-8.
- Kurnool Canal—Narratives with maps of the—(together with G.O. No. 371, dated 16th January 1881) and Madras Water-supply Project and Buckingham Canal (bound in marble). Price, Rupees 4-12.
- Leprosy—Report on the treatment of—with gurgun-oil and other remedies, Selection No. 52. Price, Annas 8.
- Lying-in Hospital—Report of— for 1878, 1879, and 1880. Each—Price, Annas 6.
- Lunatic Asylums—Report on—in the Madras Presidency for 1875-76, 1876-77, each, price, Annas 8; for 1878-79, 1879-80, 1880-81, 1881-82, and 1882-83, each, price, Annas 12.
- Madras Agricultural Exhibition Report, 1883. Price, Annas 8.
- Madras Land Revenue—Report on—for fustias 1284, 1285, 1286, 1287, 1288, 1289, 1290 and 1291. Each—Price, Rupees 6.
- Madras Medical College—Report on—for 1875-76, price, Annas 12; for 1877-78, 1879-79, 1879-80, 1880-81, 1881-82, and 1882-83, each, price, Annas 12.
- Madras Water-supply Project—Narratives with maps of the Kurnool canal (together with G.O. No. 371, dated 16th January, 1884) and—Buckingham Canal (bound in marble). Price, Rupees 4-12.
- Neigherry Loranthaceous parasitical plants destructive to exotic forest and fruit trees—Report on—, by Dr. Bidie. Price, Rupees 3-8.
- Parlakimedy—Report on the disturbances in—, Vizagapatam and Goomsoor in 1832-36. In two volumes. Price, Rupees 5.
- Productive Public Works—File of lists and maps of—. Price, Rupees 13.
- Public Instruction—Report of Director of—for 1875-76, 1877-78, 1878-79, 1879-80, and 1880-81, each, price, Rupees 2; for 1881-82, price, Rupees 4-4.
- Public Works Department—Classified List and Distribution Return of Establishment—, of the Government of Madras, corrected up to 31st December 1883 inclusive, price, Annas 12 a copy; corrected up to 30th June 1884 inclusive, price, Annas 12 a copy.
- Public Works Department—Code of Regulations for the—with forms, &c. Price, Rupees 18.
- Registration Department—Report of—for 1879-80, 1880-81, and 1882-83. Each—Price, Annas 14.
- Rules of the Road at Sea—Abstract of the—in Tamil. Price, Rupee 1.
- Standard Specifications in the Madras Presidency. Price, Annas 8 a copy.

- Survey and Settlement—Papers relating to the—for Trichinopoly. Price, Rupees 6.
- Survey and Settlement—Papers relating to the—for Salem. Price, Rupees 3.
- Tea Cultivation—Papers relating to—in Assam, Bengal, Selection No. 37. Price, Rupees 2.
- Trade Returns for 1875-76, four volumes. Price, Rupees 25.
- Trade Returns for 1876-77, four volumes. Price, Rupees 25.
- Trade Returns for 1877-78, two volumes. Price, Rupees 25.
- Trade Returns for 1879-80, 1880-81, 1881-82, and 1882-83. Each—Price, Rupees 10.
- Works—File of—for which a continuous record of expenditure is kept. Price, Rupees 18.

the part of the author. The table at foot [2] shows a list of these publications to the present date, arranged in the order of the twenty-two districts. In their preparation it has been considered desirable to allow a considerable amount of individuality, the principal original instruction being to follow generally the pattern shown in the Vizagapatam and Madura Manuals. Mr. Sturrock's South Canara Manual and Mr. Logan's Malabar Manual now awaited should contain much interesting information regarding a remarkable section of this Presidency. Under the Imperial scheme for a "Statistical Survey" of the Indian Empire, Madras has no "District Accounts;" as it was considered undesirable to discontinue the District Manual series already in part completed, and unnecessary to have both the publications of this series and the District Accounts together. As however the Madras District Manuals were not sufficiently uniform to serve as material for the Imperial Gazetteer, in the same manner as the District Accounts, material for that publication was collected and supplied to the Government of India by a special officer who obtained his information from the Collectors of districts. In other provinces the District Accounts are bound together in one set of volumes for the province, such set of volumes being termed the "Statistical Account" of the province. It was at one time contemplated in this Presidency to publish an independent "Presidency Gazetteer" compiled from the District Manuals, which would answer to these Provincial Statistical Accounts. The want of uniformity in the manuals is however a bar to the plan. A list of Gazetteers hitherto published for this and other provinces, &c., as far as is ascertained, is given in the foot-note.[3]

A list of further publications which may be classed as semi-official are shown in the next foot-note.^[*] Apart from semi-official publications the Madras Government have occasionally published at their own cost works which are more or less standard bearing on the arts, sciences, and professions, where it seemed that public interests demanded this support for the authors. An example is the History of Tinnevely by Bishop Caldwell. Till recently there was a Government Book department^[*] with depôts in various parts of the Presidency for the sale of its own educational publications, as well as that of educational books which it purchased for re-sale; these sale operations were however discontinued in March 1884, the business being taken up by the private society entitled the Madras Vernacular and School Book Society. Authors of books too numerous to mention have been assisted by the Government in the way of purchasing a considerable number of copies of their works, and distributing them for use to different offices. The Vernacular Book Publishing Society mentioned above was till lately subsidized by Government, but this has ceased. Particulars of the society may be seen in a foot-note under the article on Book Registration.

737. LIBRARIES.—Every Government office has more or less of a special library, suited for its own requirements. The Government occasionally distribute to them copies of works of which they happen to be in possession. Heads of offices are required to apply to Government to sanction the purchase of books, a list of their existing library being sent with the application for sanction and returned with the sanction. The charge is then debited to the contingent allowance of the office concerned, and the Accountant-General accepts this charge. The rules issued by the Government of India for regulating the purchase of books and newspapers or other periodical publications at the public expense are given in the foot-note.^[*] The principal office libraries are the three libraries of the Govern-

[*] SKETCH HISTORY OF THE GOVERNMENT BOOK DEPARTMENT.—The Government Book department, which supplied and distributed English and Vernacular books for the use of Government and other schools, was in operation for twenty years but closed in 1884. The agency consisted of a central depôt in Madras under charge of a curator, and subordinate to this depôt were 19 branch or district depôts at the principal up-country stations managed by local agents who were styled district curators. The curators were paid by a commission in addition to fixed salaries. Up to the year 1871 the whole cost of the Book department was included in the annual educational budget, but in the beginning of that year a change was made and salaries only were left to be provided for by the Educational department. The printing and purchase of books and other operations of the Book department were carried on by means of advances made by Government, who recouped themselves from the sale proceeds of books. This system was successfully worked for nearly nine years, and the department became fully self-supporting, leaving in fact a surplus after the payment of all charges including the salaries provided for in the educational budget. The selling prices of books were fixed on the following system. In the case of English books imported an addition of 20 to 25 per cent. was made to the published price. In the case of Indian books locally purchased, 10 per cent. was added to the published price, taking no account of the discount allowed by the publishers. With regard to books printed for the department, 25 per cent. was added to the cost price in the case of editions of new books, and this margin was worked up to 50 per cent. by reducing the cost of printing in the case of fresh editions of old books. The former charge included the amount paid to the author or compiler, while the latter secured a margin of profit without any addition to the price first fixed. In April 1881 the financial management was changed on the suggestion of the Comptroller-General that an Incorporated Book Depôt Fund should be constituted so that all receipts and charges might be taken to this fund, and the receipts paid in at any treasury to credit of the fund, thereby avoiding the necessity for the issue of transfer receipts for remittances to mofussil booksellers and printers as well as to district curators. In the same year the system of allowing a discount of 10 per cent. on wholesale purchases to the extent of Rupees 250 or more at a time was introduced to encourage private trade, and this system was afterwards extended to mofussil dealers to pave the way for the abolition of the district depôts. The process of abolition was gradually carried out and was completed on the 31st March 1883 in the case of district depôts. The central depôt was closed on the 31st March 1884, and the business of the Book department was thus transferred to private enterprise.

[*] RULES REGULATING PURCHASE OF BOOKS, &c.—Application of Rules.—These rules apply to books or newspapers purchased at the cost of the Imperial and Provincial Revenues and of Incorporated Local Funds, but not to those purchased on account of Excluded Local Funds. (2) Sanction of Government.—Books and newspapers or other periodical publications, whether published in or out of India, shall not be purchased or subscribed for at the public expense by any public officer without the previous sanction of the local Government, or, in the case of officers under the Government of India, of the department to which the officer is subordinate. (3) Books for the Military Department.—Books for regimental schools, regimental and prison libraries, and military officers, will, so far as the requisitions are in accordance with the rules in force in the Military department, be brought under the orders of the Government of India in the

ment Secretariat in its Public, Revenue, and Public Works departments; and those of the Adjutant-General, Director of Public Instruction, Superintendent of Surveys, and Surgeon-General with the Government of Madras. These libraries are recruited from time to time, by departmental reports and selections from records received from the several Indian Governments and Administrations, by Parliamentary Blue Books and other papers sent by the Secretary of State for India,^[1] by books published or patronized officially as above mentioned, and by books purchased by the Government on occasion arising. The greater part of these operations take place in the Public Department. Among libraries belonging to educational institutions, which are in a greater or less degree official, are those of the Presidency College, containing 3,700 volumes, Civil Engineering College, containing 1,989 volumes, and Medical College in Madras, containing 7,898 volumes—5,882 volumes in the Professors' library and 2,016 in the Students' library; and the Combaconam, Rajahmundry, and Bellary Colleges in the mofussil. The public and scientific libraries attached to the Government Central Museum at Madras are mainly supported by the Government, but are open to the public, and in that capacity are much utilized. In 1861 the libraries at Hayleybury and the India Office having been amalgamated, there was a surplus collection of valuable books, amounting to about 10,000 volumes. A portion of this collection was received by the Madras Government in 1863 and handed over by them to the Museum to form the nucleus of a public library. It has largely increased since that date and now numbers 4,332 volumes. The aim has been to make it a general collection of all books, old and recent, bearing on the history, antiquities, religion, &c., of the people of Southern India, and of standard works of a national character of the same class. In addition to the works purchased out of the annual Government grant of Rs. 1,200, a large number of books are presented by the several Governments of India, the Secretary of State, the Master of the Rolls, and various scientific institutions. The scientific library of the Museum contains a valuable collection of scientific works and periodicals required for the conduct of work in the different sections of the Museum. It embraces many standard works, some of which are almost, if not wholly, out of print, and the collection has been systematic labor, extending over a number of years. The grant for the purchase of new works is

Military department for the Bengal Army, and of the Governments of Madras and Bombay for the armies in those presidencies. (4) *Books for the Educational Department.*—Books for the Educational department should be obtained under the present rules and usage of the several local Governments concerned. (5) *Proof of Sanction.*—The officers of the Account department are enjoined to require proof of such sanction before admitting charges of this character. (6) *Supply of Books.*—Government does not undertake to supply books and newspapers indiscriminately, and supplies must be confined to what is found actually necessary for the public service independently of the desire of officers for improvement on subjects connected with their duties. Purchases of hand-books, manuals, practical guides, and the like should be rarely, if ever, made for executive officers, but mainly for officers charged, among other duties, with important deliberative duties of advising Government on special or important subjects. (7) *Legal Commentaries.*—Commentaries or annotations on Acts of the Legislature will in no case be supplied by Government. (8) *Directories.*—Directories and works of a cognate character can only be allowed under special circumstances where there may be evident inconvenience to the public service if they are not at hand for reference. (9) *Indian Official Publications.*—Official publications issued in India, such as the Postal Guide, the Civil Lists, the Codes of the Financial or Public Works Department, the Army Lists, &c., are to be supplied only under instructions from the Local Governments or departments of the Government of India. No payment should be required for books of this class. (10) *English Official Publications.*—Official publications (other than Parliamentary papers) published in England should be procured by the departments of the Government of India, and by the Local Governments and Administrations requiring them for their own use and for the use of the officers subordinate to them, by indents forwarded to the address of the Assistant Under Secretary of State for India; the revenues (Imperial, Provincial, or Local) to which the cost is chargeable, and, if Imperial, the head of account or grant to which it is debitable, being specified in the requisition. The following are not to be considered official publications:—Acts of Parliament (except Mutiny Acts, which the Secretary of State will supply); London Gazette; War Office Army List; British Postal Guide; British Code List; Royal Navy List. Mercantile Navy List. (11) *Parliamentary Papers.*—Parliamentary papers required for departments and officers elsewhere than in the Presidencies of Madras and Bombay will be supplied as published by the Secretary of State to the Home Department of the Government of India under the terms of his despatch No. 6, dated 13th January 1876. All communications regarding their distribution should be made to the Secretary to the Government of India in the Home Department. Parliamentary papers required by the Governments of Madras and Bombay should be obtained direct from the Secretary of State. (12) *Registration of Books.*—All books and periodicals procured for any office should be registered or filed, and must not be permanently removed from the office for which they were intended. (13) *Payments for Books.*—Payments for books, newspapers, and periodicals procured from abroad should by preference be made in India either through an agent or a bank on bills drawn by the supplier. When this is not practicable, the remittance should be made invariably through the local Accountant-General and the accounting officers of the Military and Public Works Departments, who should be responsible for the purchase of bills.

[¹] **LIST OF PARLIAMENTARY PAPERS SENT TO THE GOVERNMENT BY THE SECRETARY OF STATE.**—Papers specially relating to India, under headings of (a) All subjects; (b) Sanitary measures. Mint, Coinage and Currency; Railways; Agriculture; Statistical Returns generally; Statistical Abstracts; United Kingdom, Colonies, and Foreign Countries; Trade and Navigation and Trade and Navigation Monthly Accounts; Commercial Reports; Merchant Shipping; Rule of the Road at Sea; Colonial Possessions; Criminal and Judicial Statistics; Law Reports; Prison Reports; Education, Civil Service Commissioner's Reports; Scientific Instruction; Meteorological Reports; Public Health; Local Government Board Reports; Local Government Medical Officer's Report; Registrar-General's Report; Lunacy Reports; Census and Population; Fisheries; Army Medical Reports and Health of the Navy; Factories and Workshops; Inspector's Report.

Rupees 500 per annum. The library of the Madras High Court contains a valuable collection of legal works. It is open to the legal profession and to the public generally on an order from one of the Registrars of the Court. The library of Oriental Manuscripts [a] at the Presidency College under charge of the Sanscrit Professor of that college contains 11,000 manuscripts, of which 6,500 are Sanscrit. This library is much frequented by pundits, who come to consult or copy the manuscripts, more frequently the latter. The most important library not belonging to Government is that of the Madras Literary and Auxiliary Royal Asiatic Society, located in the Old College, Nungumbaukum. It contains about 26,000 volumes. The society was founded in the year 1817 by Sir Thomas Newbolt, the then Chief Justice of Madras, and has therefore been in existence now for nearly 70 years. Its affairs are managed by a committee of twelve members elected at the general meeting held each year in the month of March or April. In addition to its members proper the society also extends the use of its library to the reading public at a low rate of subscription graduated according to the pay of the person
 ling is lent by Government, and as a branch of the Royal

was begun i
 of 39 numbers. The second series began in October 1856 and ended in December 1861 and consists of 12 numbers. The third series published in July 1864 and October 1866 contains 2 numbers. The fourth series of the journal comprises an annual publication for the years 1878, 1879, 1880, and 1881. The Neilgherry Library at Ootacamund was founded in 1859, and contains about 10,500 volumes. In 1860 Government made over to the committee of the library the public bungalow at Ootacamund with the ground on which it stood, and the museum at Ootacamund was transferred to the charge of the committee with the allowance of Rupees 100 hitherto granted to the museum which was to be appropriated for the joint expenses of the united institution. This allowance was granted from the 1st June 1860 and discontinued from the 1st July 1875. The house given by Government was rebuilt by the committee. The library is now a non-commercial joint stock company, having been registered on the 4th January 1878 under India Act XXI of 1860, which provides for the registration of societies or companies established for the promotion of literature, science or the fine arts, or for the diffusion of useful knowledge, or for charitable purposes. The institution is managed by a president and twelve members, one of whom is appointed by Government. The president and eleven committee-men are elected annually by the members. The Mahomedan Public Library at Triplicane, Madras, was established in 1850 by the Mahomedan inhabitants of Madras. The late Nawab of the Carnatic gave a donation of Rupees 700 and a monthly subscription of Rupees 35, and books were received from the Governments of Madras, Bombay, and Agra and the Pashah of Egypt. When the Madrissa-i-Auzum was taken under the management of Government in 1859, the monthly allowance of Rupees 35 was continued to the library by Government from the amount granted by the late Nawab of the Carnatic for the expenditure of the Madrissa-i-Auzum. The library is managed by a committee consisting of a president, ten members, and a secretary. The Public Library at Cochin received a grant of Rupees 50 per mensem from 1868 to 1876. Various other libraries have been helped from time to time.

[a] SKETCH HISTORY OF THE MADRAS LIBRARY OF ORIENTAL MANUSCRIPTS.—The Library of Oriental Manuscripts originally formed part of the museum of the Madras Literary Society. It was transferred to the Old College and placed in charge of the Board of Examiners. In 1867 the library was transferred to the Director of Public Instruction. In 1868 the Professor of Sanscrit in the Presidency College was directed to carry out certain orders issued by the Government of India in regard to the discovery and preservation of the records of ancient Sanscrit literature. He was to take such measures as might be necessary for commencing the printing of all procurable unprinted lists of Sanscrit manuscripts in the native libraries. He was also to arrange for the examination of the manuscripts named in the native catalogues as above described, for the discovery of new manuscripts, for their purchase, and for the employment of copyists to transcribe codices which were unique, extremely old, or otherwise desirable, but which the possessors refused to sell. He was to make occasional short tours for these objects and was to take advantage of every opportunity of inquiring for and procuring any ancient manuscripts in the vernacular languages which he might consider to be of historical or literary value. The Oriental MSS. Library was in 1869 placed in charge of the Professor of Sanscrit in the Presidency College. In 1873 the Professor of Sanscrit was appointed Curator with an allowance of Rupees 100 per mensem. The first volume of the lists of Sanscrit manuscripts in private libraries in Southern India has been published. It contains a description of 8,376 manuscripts. A second volume, which contains the names of over 9,000 manuscripts, is in the press, and will soon be issued.

738. SPELLING FROM THE VERNACULARS.—In the transcription of vernacular words in English documents,^[*] there are as is well known two different styles or systems, and the Presidency is in a state of transition from one to the other. The

[*] SKETCH HISTORY OF MEASURES FOR REPRODUCING IN ROMAN LETTERS VERNACULAR INDIAN WORDS.—*Introduction.*—The necessity for adopting some system with a view to securing uniformity in this matter has been apparent for a long period, and the necessity has increased with the extended use of the English language among the natives of the country themselves. The chief reason for introducing into India a special Roman alphabet differing from that which belongs to the English language, if as seems probable that is the result which will be finally arrived at, will be more of a political than of a literary nature. An examination of the literature which has grown up on the subject shows that the prevailing motives which have regulated the steps already taken are rather those of presenting India with the best available means of rendering the country homogeneous in the important particular of language, than of merely satisfying technical claims of philology. (2) *Early phoneticism.*—At the beginning of the British occupation of India, the vernacular characters were not read by Europeans. Hence vernacular words could only be transcribed by the

"Sir Roger C and Romans had the same method throughout their history for transcribing words and names. Leghorn and Naples in English, and Écosse and Galles in French, are extreme modern examples of the same practice. A publication called the "Institutes of Timour" by White issued in 1784 is said to have employed on system an entirely phonetic scheme for transcribing vernacular words; the method being advised by Major Davy, an officer who had studied Persian in this country. The details are not to hand, and it is not understood in what way an absolutely phonetic method was reduced to a written system. (3) *Change to transliteration.*—As opposed to the phonetic method which transcribes by ear is the transliterative method which consults the original vernacular written character and transcribes from that. The latter must have been more or less the method of the great majority of educated Europeans from the earliest period of literary activity in India. Spelling by ear has developed certain conventional forms which have since been retained. In some of the niceties of language where literal transcription would confuse the reader, that has been abandoned. But with these exceptions vernacular spellings in the Roman alphabet have been transliterative, that is to say from the written character, for the last century. Under these circumstances the nomenclature which has been used to designate the rival principles operating in the subject have not been well-chosen, and a confusion of idea has arisen which has continued to the present day. Gilchrist's method hereafter to be mentioned has been called phonetic, and the Jonesian method has been called transliterative. The real antagonism however between these two typical systems lies in the fact that the aim of one is to solve the problem while following the genius of the English language, and in the other English principles are put on one side and those of continental nations are adopted. The acrimony which has been noticeable in the discussions of the last century arises out of this antagonism, and not out of any divergence in the literary methods. Gilchrist's and Jones' systems are both essentially transliterative, and the former is merely specially favorable to phoneticism as an incident of the general system. (4) *Halhed's transliteration.*—The subject of Roman transliteration first arose in Northern India. The first writer who accurately gave to the public the Nagaree, Devanagaree, and Bengalee alphabet was Mr. Halhed in the preface to his version of the Code of Hindoo Law, compiled under the orders of Warren Hastings in 1775. His consonants corresponded very nearly with those of Sir William Jones' alphabet next to be mentioned, except that he made no distinction between the hard and soft *d*, *t*, *ḍ*, *ṭ* and *tʰ*. The short vowel *ḥ* he wrote with a short *e*; the letter *ḡ* with a double *ḡ*, bearing similarly the short mark; *ṛ* was expressed by *ḍe*. *ṛ* he wrote *i*; and *ṣ* *ou*. Every

vowel according to this system had its long or short mark above it, which was very inconvenient whether for printing or writing. (5) *Sir William Jones' transliteration.*—Sir William Jones, not satisfied with the system of Mr. Halhed, devised the alphabet which bears his name. See the paper "A Dissertation on the Orthography of Asiatic Words in Roman Letters, by the President, 1788": in the "Researches of the Asiatic Society of Bengal," Vol. I; also in the collected works of Sir William Jones, I, p. 176. He provided for all the sounds used in Sanscrit, Arabic, Persian, and Hindoo. He discarded the system, by which the pronunciation of Asiatic names was to be shown by English letters, because there were no consistent rules of orthography in English, and every vowel might be used to articulate one and the same sound. He gave the following sentence as an example—"A mother bird flutters over her young;" in which every vowel and the diphthong *ou* have the sound of *u* in *but*. He therefore decided to use the Roman or Italian sounds of vowels. This system was adhered to by Colebrooke and Wilkins. It prevails in the "Asiatic Researches," in the "Journal of the Asiatic Society of Bengal," and in the "Journal of the Royal Asiatic Society." It was adopted by Rottler in his Tamil dictionary, by Campbell in his Telooogo dictionary, and by Shakespeare in his Hindostany dictionary. (6) *Dr. Gilchrist's transliteration.*—Dr. John Borthwick Gilchrist soon afterwards became the advocate of a system based on English powers of vowels, differing considerably in its details from Halhed's. He used the short *u* instead of *a* for the silent unexpressed inherent letter of the languages of India, and retained the English *so* instead of the continental *u* of Jones. He also discarded the continental *au* of Jones (for *ow* in *how*) and substituted *ou* in its place. Dr. Gilchrist's plan became more popular than Sir William Jones'. In fact in its essential features it continued existing practice. His principal works are—"A Grammar of the Hindostany Language, or Part I of Vol. I of a System of Hindostany Philology," by John Gilchrist (Calcutta, 1796); and "Hindostany Philology, comprising a dictionary, English and Hindostany, with a grammatical introduction," by John Borthwick Gilchrist, LL.D., Hindostany Professor in the College of Fort William (London 1810, again 1836). (7) *Tabulation of these three systems.*—The following table exhibits the vowel transliterations of the three systems just mentioned in one view. It is not difficult even thus on cursory inspection to pronounce on their respective merits. Halhed's system was clumsy, and need scarcely be considered. Jones' system was perfectly symmetrical; but it had the disadvantage of being composed of un-English, indeed anti-English, materials. Gilchrist's system was only a rough transliteration; on the other hand it had the merit of being in accordance with English nationality:—

Halhed.	Jones.	Gilchrist.	English equivalents.
ḥ	a	u	As a in about, or u in up.
ā	ā	a	As the interjection ah.
e	e	e	As ey in grey.
ḡe	i	i	As i in pin.
ḡe	ī	ee	As ee in meat.
o	o	o	As o in note.
ḡo	u	oo	As oo in good.
ḡo	ū	oo	As oo in moon.
ai	ai	y	As ei in height.
ou	au	ou	As ow in cow.

(8) *Controverses regarding the Jonesian and Gilchrist systems.*—The names of Jones and Gilchrist became the watchwords of two rival systems or rather principles; and those who followed them maintained for thirty years a

traditional style employs the English powers of vowels, and to a certain extent applies the phonetic principle. Its characteristics are analysed in Vol. II, App. XXI. It has a firmer footing probably in this Presidency than in other parts of India;

lengthened discussion, while much confusion prevailed in the spelling of the general public. Except among the learned, there was a decided leaning from the first in favour of Gilchrist's system. The Asiatic Society endeavoured to push the Jonesian system, but the Government followed the other. In 1834 a controversy arose as to the general question of employing Roman alphabets. Mr. Thompson, a missionary at Delhi, had written an English and Oordoo dictionary in Roman characters, which Dr. Yates, another missionary, recommended to the Calcutta School Book Society. Mr. H. T. Prinsep objected to the innovation, while Dr. Duff defended it. Sir Charles Trevelyan, then a young civilian, strenuously supported the publication of vernacular books in the Roman character. He obtained the assistance of four missionaries, Messrs. Duff, Yates, Pearce, and Thomas, for the purpose of printing and circulating such books, and fifty-seven had been published by the end of 1836. Meanwhile a controversy was carried on between Sir Charles Trevelyan and Mr. H. T. Prinsep as to the merits of the rival systems of transliteration, the latter maintaining the superiority of the system of Dr. Gilchrist. Mr. Prinsep said that the system of Sir William Jones was a style of writing to be revered and respected, but not imitated; and that it should be reserved for recondite science. Mr. Trevelyan replied that the phonetic system of Dr. Gilchrist was not a system of orthography, but of cacography; or of confusion, mystification, and absurdity. While such was, he maintained, the plan of Gilchrist, the system of Sir William Jones, after having completely stood the test of learned criticism, after having gone through a probationary period of sixty years, and approved itself to the great body of scientific men throughout the world, was at last claimed for general use. It was true, as Mr. Prinsep has urged, that it had long remained unused except by scholars; but that was no reason why it should continue to be so. "The jewel," he declared, "must no longer remain shut up in a casket, but must be brought forth to shine in the face of day. The money must no longer remain hoarded in the treasury, but must now pass into circulation." Mr. Trevelyan returned to England in 1838 and published his work on the education of the people of India; but the four gentlemen who had been allied with him continued their labours, and in 1857 it was reported that the Roman character, with the Jonesian system, was universally used by the missionaries in the Upper Provinces. In 1845 Mr. Crow, a Deputy Collector, published an ingenious treatise on the best mode of writing oriental words, in which he advocated a system akin to the Jonesian. But in the same year Sir Henry Elliot published a work in which "he conformed to the system of Gilchrist, or rather to that modification of it in use in our Revenue Survey, which certainly has the merit of enabling an Englishman to pronounce a word in such a manner as to make it easily comprehended by the natives of Hindostan; while Sir William Jones' system is better suited to the learned." Moleworth also adopted the system of Dr. Gilchrist in his *Mahratty dictionary*. When Professor H. H. Wilson published his *Glossary of Indian Terms*, he adopted the system of Sir William Jones throughout, discussing the whole question in his preface; and he gave equivalents in Roman characters for every letter in nine alphabets used in India. A key however was provided at the end of the book, in which popular spellings were given, with a reference to the equivalent scientific form in the body of the work. In 1858 the controversy broke out afresh and was carried on with some spirit in the "Times" and other English newspapers; with Sir Charles Trevelyan, under the signature of *Indophilus* and Mr. Monier Williams on one side, and Professor Garrett on the other. Sir Charles Trevelyan became Governor of Madras in the same year and endeavoured to introduce the Jonesian system there in official correspondence; but without effect, as will be seen later on. The Jonesian system also found an advocate in Mr. Eastwick, who edited Murray's *Handbooks for India* in 1859; and Keith Johnston adopted it for the maps of India in his atlas published in 1861. It was also adopted by Mr. Thomas in his system of transliteration and application of diacritic marks to English type in the "*History of India by its own Historians*;" and it is explained in a pamphlet issued by the Philological Committee of the Asiatic Society of Bengal. The Syndicate of the University of Calcutta, in 1859, published a key to Professor H. H. Wilson's system of transliteration as modified by that body. In this pamphlet it was observed that a general disregard of all fixed rules of spelling prevailed; and it was hoped that the adoption of a fixed system by the Calcutta University and the Education Department in Bengal would have the effect of gradually securing a general uniformity of spelling throughout the country in public documents and in literary productions. This key gave a complete and an optional form of Roman equivalents to be used for the letters of the Sanscrit, Bengalee, and Arabic alphabets. Every Indian letter must, in accordance with the rule of Sir William Jones, be represented by its fixed Roman equivalent. The vowels were to have powers as in Italian, but not as in English; diacritical marks attached to consonants might at option be omitted in writing proper names; accents on long vowels must invariably be inserted. But the English system, first advocated by Gilchrist, in spite of these endeavours made against it, continued to maintain its ground with the public; and even among literary men to have powerful supporters, chief among whom were Mr. Marshman and Colonel Meadows Taylor. The latter observed that the English language possessed phonetic equivalents for all sounds in Indian proper names, and drew up and submitted to the Secretary of State a set of simple rules in illustration. It is to be observed however that Colonel Meadows Taylor's rules make free use of the acute accent, which is not an English device; they are consequently of the nature of a compromise. The last book requiring notice in this connection is "*Remarks on the Orthography of Indian Geographical Names, with especial reference to the proposed new Indian Gazetteer*," by the Rev. T. Barton, M.A., late Principal of the Cathedral Mission College, Calcutta (Stanford, 1871). Mr. Barton deprecated the notion that the claim of linguistic science and the necessities of popular usage were so opposed to one another as to be altogether irreconcilable. He proposed that in a gazetteer or other similar work the scientific spelling should follow the popular one in each case in brackets. He thought that the requirements of popular utility might thus be reconciled with the claims of science.

(9) *The Madras Literary Society's Sub-Committee of 1859.*—In 1859 the Madras Literary Society, which is an auxiliary of the Asiatic Society, took up this question from the point of view of the Jonesian system. They appointed a sub-committee to report on the best method for applying that system to the vernaculars of the Madras Presidency. As their report is the first and last paper on the subject, it will here be abstracted with some fulness. (10) *Their general principles.*—The sub-committee defined their own aim, as that of "laying down a scheme of orthography which should provide for the exact representation of every word occurring in the languages of India, under conditions at once easy of application and so exact, as to enable persons acquainted with the original tongue, to reproduce words written according to it in their native characters." More particularly they said that they desired to submit a system of notation, in which "each original (represented) sound should be rendered invariably by one appropriated symbol, conformably to the natural order of articulation, and with a due regard to the primitive power of the Roman alphabet, which modern Europe has in general adopted." For the accomplishment of these ends, they prescribed to themselves the following fundamental rules:—"a." That a distinct Roman character should, as far as practicable, be employed to express each established oriental letter, in other words that an oriental letter should have only one Roman equivalent. "b." That the same character should always represent the same letter, and should never be employed without some distinguishing sign to designate a second; in other words that an oriental letter should have not less than one Roman equivalent assigned to it, should not share a Roman equivalent with some other oriental letter. "c." That two or more letters should never be employed where a single character could be made to suffice. "d." That diacritical marks should only be resorted to in the last necessity, and should be of the simplest description. "e." That varieties of type, as capitals, italics, black letter, should be considered inadmissible. The propriety of the three first stipulations is manifest where they are practicable, and needs no illustration. The two next were dictated by the difficulty of using the modifications there mentioned in current writing, to say nothing of their unsightly and perplexing appearance. (11) *Their views regarding various schemes.*—The modifications which had been proposed in Sir W. Jones' orthography since its first promulgation, and which related chiefly to the mode of representing certain consonants, were examined by the sub-committee. Among these the most important were the alphabet adopted by the missionaries of Upper India in numerous works printed and published; that employed by Shakespeare in his *Hindustany Dictionary*, 3rd

this Presidency having been the scene of the earliest English occupation, and also for reasons connected with the nature of the Dravidian languages themselves. The new style employs the Italian powers of vowels, and is more exclusively translitera-

edition, 1834; and that prefixed by Professor Wilson to his Glossary of Indian Terms, 1856,—the last of which exhibited the first attempt to elaborate a scheme embracing all the languages of India. There were also to be considered the modifications observed in the published works of German and French philologists. The Missionary alphabet of Bengal, which had only been applied to Oordoo, was held to be inapplicable, because it sacrificed critical accuracy to simplicity. The letters *a* and *c* were both represented by *h*—*ه* and *ج* were all included under *s*—*س* and *ج* under *s*. The principle of strict transliteration was thus abandoned. The plan proposed by Shakespeare was free from this defect, but was also confined to the Oordoo dialect in its Arabic and Devanagaree forms. In the opposite direction from the Missionary alphabet, it contained redundancies, providing for distinctions of sound not expressed by corresponding letters, but to be acquired by practice, and therefore considered by the sub-committee unnecessary in a scheme of strict transliteration. There were also some minor blemishes in his mode of dealing with *ch*, *ch'*, *gh*, *kh*, *ksh*. Professor Wilson's scheme was complete in its requirements, but cumbersome in the mode by which he had carried them out. Thus, five of the six characters for *a* were represented by infra-linear diacritical marks, of which the first was an open dot, and the rest points increasing in number from one to four. The three *z*'s and three *s*'s were similarly distinguished. Such complications are perplexing in type and unsuited to cursive writing. (12) *Their views regarding diacritical marks for consonants.*—On a general comparison of the details of Sir W. Jones' scheme and the three just enumerated, it appeared that the mode of designating the vowels was nearly the same in all; and that as to the consonants, while Sir W. Jones adopted a system of supra-linear marks to distinguish them, his followers had substituted various infra-linear signs differing only in the greater or less simplicity of their application. This introduced the question of the position of the diacritical mark. If a printer is asked, whether with an ordinary font of types it is easier to add diacritical marks above or below the line, he will give the preference to the former and to those of the simplest description only. The use of accentual signs above the line is of ordinary occurrence in every press. Hence the original scheme proposed by Sir W. Jones possessed this advantage of facility of application. It appeared to the sub-committee that a combination of both systems, the supra-linear and the infra-linear, would be found to afford the best means of securing perspicuity of notation with easy application. (13) *Their proposals regarding the Devanagaree alphabet.*—The sub-committee then proceeded to examine the Devanagaree or Sanscrit alphabet. There is a class of letters in the Nagaree alphabet, commonly denominated cerebral. This rendering of the Sanscrit grammatical term (*mūrdhanya*), from (*mūrdhan*), "the head," has been objected to, and the word lingual proposed instead. The "causinal," has also been proposed. The sub-committee recommended that this class of letters should be indicated by a single diacritical point below each letter. The expedient adopted by Sir W. Jones to indicate aspirated consonants by the apostrophe used to signify the soft breathing of the Greek alphabet, and to some extent recognized in the Roman, appeared to be peculiarly appropriate. It was first devised by Halhed, who placed it at the bottom of the line, in which he was followed by Gilchrist. Sir W. Jones removed it to the top. Klaproth and Bopp applied it to the same purpose, omitting the *h* and reversing the comma. Although the Jonesian application had not been so generally employed as it seemed to deserve, the sub-committee recommended its adoption on the grounds of fitness, perspicuity, and easy application. It set free the similar characters used to represent *ç* and *ê* with the addition of diacritical marks, and obviated the possibility of mistaking the sound of the aspirates themselves, especially in the familiar English pronunciation of *th*, *ph*, *ch*, &c. The strong aspirate at the close of syllables in Sanscrit words, called visarga, might be represented by a similar device, or the spiritus asper might be substituted, as *h*. This could never occasion confusion as the visarga always follows a vowel. Of the Nagaree sibilants, the only one calling for consideration was the first—or *ṣ* often inaccurately confounded with the second, or *ṣ*, and even with the third, or *ṣ*. This class of consonants in the notation here proposed was to be expressed by acute accents above them, to denote an aversion of the tongue towards the palate, whence the letter is called the palatine *sa*. In the same manner might be noted the *sād* of the Arabs and Hebrews, which last it resembles in shape, and probably resembled in sound. The nasals were five in number. Thus "*a*," the anooawara, signified by a dot above the line, and therefore most fitly represented by a Roman *ā* with a similar mark. "*b*," For the guttural *n*, or that pertaining to the first class of Nagaree letters, a compound or double symbol might with propriety be adopted. Its sound is exactly that of the letters *ng* in sing, long, &c., and these letters therefore seem to present the fittest substitute. Sir W. Jones objects to the addition of the *g*, on the ground that it might create confusion, and often suggest the idea of a different syllable. This difficulty might be overcome by tying the two letters with an infra-linear line, but such complicated signs were objectionable in themselves, and were moreover prescribed by the third rule. The line below the *n* alone might therefore be retained as the characteristic of this sound. Sir W. Jones, viewing it as identical with anooawara, employed the same mark for both, but in doing so, transgressed the fundamental rule which requires exact transliteration. "*c*," and "*d*," The palatal and cerebral *ns* should, by analogy, follow the rule already provided in such cases, the former being represented by an accent above, the latter by a point below, the line. But as the sound of the first is exactly identical with that of the Spanish *ñ* and Portuguese *nh*, and provision had to be made for another more purely palatal *n* in the Tamil *ṇ*, it seemed advisable to adopt the Spanish *ñ* which presents a familiar representation of the exact power of the Sanscrit letter, and thus to leave the palatal symbol available for the Tamil *n* or *ṇ*. "*e*," The last or simple *n*, needed no distinguishing sign. The Sanscrit alphabet concludes with a character expressing a sound compounded of *k*, *s*, and *h*, which it has been usual to represent by these three letters in sequence. Others had employed the Roman *sh* for the same purpose, and considering that this letter was also a compound of *k* and *s*, and was not otherwise required, the sub-committee recommended that it should be appropriated to that sound. The conclusions thus arrived at for the Devanagaree alphabet will be found with very small variation embodied in the table at Vol. II, App. XXIV. (14) *Their proposals regarding the Dravidian alphabets.*—Considering the peculiar character (see Vol. II, App. XXVII) of at least two of the Dravidian alphabets, the Tamil and the Malayalam, and the fact that the Dravidian languages are exclusively the languages of this Presidency, the sub-committee's remarks under this head are scarcely on a par with the subject. However, as above stated, the report forms the first and the last published document on the subject, and its conclusions will be here arranged in the best practicable way. Many of the Tamil and some of the Telugoo letters are liable to changes of sound with reference to their position or to their derivation from Sanscrit, and the sub-committee began by discussing the propriety of providing distinct Roman equivalents for such sounds. They came to the conclusion that it was unnecessary, in a system of strict transliteration, to provide more symbols for a letter, however variable in sound, than the people possessed themselves. In using a romanized character, such anomalies must therefore be learnt by practice; as they are at present mastered by the natives themselves, who employ the vernacular characters under precisely similar circumstances. The only exception which appeared necessary was in the reduplicated Tamil sounds of *ṣ*, *ṭ*, and *ṭ* or *ṭ*, *ṭ* and *ṭ* which become *tt*, *tt* and *ṭṭ*, and this had long received the sanction of general usage. These were therefore admitted. The sub-committee stated that they had also adopted the rule which gave the normal sound of the Devanagaree characters to words adopted into Tamil, and had represented them by their corresponding Roman letters. Beyond this bare statement, the sub-committee did not indicate how the principle was to be applied; it will be found in practice a considerable difficulty. The Telugoo and Canarese people have taken the Nagaree letters under altered forms, and the Nagaree alphabetic system more or less intact, to answer their own purposes. The sub-committee proposed for these therefore the mere application of the conclusions already arrived at for Nagaree. The same is a less degree for Malayalam. The Tamil alphabet is so diverse from the Nagaree that it should have been treated separately and as a whole. However the sub-committee treated it merely as showing so many variations in detail from the general scheme. The arrangement for reduplicated Tamil

tive. A complete transliteration table under this system, based on the report of a committee which considered the subject in 1858-59, will be found in Vol. II, App. XXIV. The strictness of the transliteration compels the use of numerous diacriti-

sounds has already been mentioned. The sub-committee further remarked that there were seven letters entirely peculiar to the Dravidian dialects, which were probably once common to all, but the whole of which were found in Tamil alone at the present day. These were *எ ஐ ஓ ஐ டு டு ன* and *ஊ ஊ*. Of these, the three first only had been retained in Telugoo and Canarese, and the five first in Malayalam. The two last were confined to Tamil. The two vowels are simply the short sounds of *e* and *o*, and as the corresponding Sanscrit vowels are always long and are so marked by an accent, they could be written merely by *e* and *o*. The Tamil *ஊ*, Malayalam *ஊ*, and Telugoo and Canarese *ஊ* was not unknown to the Nagaree alphabet, and was still found in the older Sanscrit of the Vedas, but it had fallen into disuse. It came under the head of cerebral sounds and was therefore properly represented by *j* with the mark assigned to that class. The Tamil *ஐ* or Malayalam *ஐ* had the force of a prolonged palatal *r*, of which the Hindee *रि* seemed to be the Oordoo equivalent. In its reduplicated form it became *ri* and would be rightly typified by these corresponding letters with the palatal sign—*or r̥* and *ri̇*. The next letter *யு*, which was confined to Tamil and Malayalam, might be termed the 'rexta litera' of the Dravidian, as *ξ* was of the Semitic tongues. For the difficulties which impede the appropriate rendering of this sound reference may now be made to Vol. II, App. XXVIII. The various expedients which have been proposed by different writers resolve themselves into a choice between *r* and *l*, if a single letter is employed; or *sh* if a compound character is admissible. The sub-committee observed that two of the highest authorities in Tamil literature, Dr. Caldwell and Dr. Pope, had pronounced the letter on philological grounds to be a form of *r*; but general use and analogy were in favor of considering it a cerebral *l*. The sub-committee therefore resolved to adopt the latter. There being already two *l*'s, the proper diacritical mark would be a point above, but this being unsuited to the shape of *l*, they resolved to recommend a line below, or *l̄*. In the present work it will be observed that *sh* has been adopted. The Tamil *ஊ* seemed to differ in no wise from the ordinary *u* fully enunciated as a palatal sound. It should therefore be noted as *u̇*. The last letter or *ஊ* was the equivalent of the Arabic *kh*, and should be represented by *kh*. The proposals here made for Tamil would amount roughly to what is shown at Vol. II, App. XXIV, if the greater number of the exceptions given in the note thereto appended were withdrawn. *ச, ஃ, ட, டு* may be read respectively as *k* and *g*—*s* and *ch*—*t* and *d*—*p* and *b*; depending on the position of the particular letter in relation to others. No provision is made by the sub-committee for these variations. Had they given examples of, or even tabulated, their results, the impossibility of transliterating Tamil in this way would have been apparent. The words would have appeared in such an anti-phonetic guise as plainly to run counter to common sense, and would have condemned the proposals. Considering that Tamil is the most important language of the Presidency, this is a very serious omission or oversight. It is scarcely too much to say that it has left the whole question of transliteration on the Jonesian system for this Presidency an undecided point, in spite of the laborious nature of their report. (15) *Results of their report.*—This report was put out in a form which would have almost denied it any currency, whatever its intrinsic merits. The only tabulation it contains is that of the Sanscrit alphabet, which though it may be the basis of others does not represent immediate practical requirements. The treatment of the Dravidian languages, the real languages of this Presidency, is only to be gathered from some detached and not very clear paragraphs. That the Tamil question has not been actually met has been stated above. Considering the difficulty of the whole subject, a less satisfactorily framed document viewed as a practical key to the situation could hardly be desired. Nor are the results much more free from objection, even if they had been offered in an intelligible form. The framers of the report were evidently not conscious of any pedantry in their proposals, and considered that they had offered something adapted to general use. The Literary Society, in forwarding their sub-committee's report, speak of it simply as a "scheme," as if it were something complete and ready for use; and recommend its immediate adoption by all public officers whenever a word is introduced into writing which is not strictly English. When it is considered that at this time in Southern India scarcely any one except a few savants knew of the existence of a method of writing vernacular words other than the traditional English method, and that in this scheme which was offered for immediate and universal adoption the whole vowel system of the English language was subverted and every second letter was weighted with a diacritical mark, at that time to officials and the public a complete novelty; it must be admitted that the proposals were eminently ill-considered. Even with the assistance of the Government, which as will be mentioned later on they obtained no notice was taken of the scheme. It died a natural death almost as soon as it appeared. There has been no subsequent examination of the subject in Southern India. (16) *Official measures in other provinces down to 1868.*—Official measures in other parts of India contemporaneous with the above discussions and schemes may be thus briefly stated. In 1820 the Bengal Government ordered an accurate record to be made in English of the land tenure, and uniformity became an important object. Dr. Gilchrist's scheme, in a simplified form, was then adopted, and the same system was used for maps and revenue survey records. Different record committees succeeded in reforming the orthography of names of places on this system, and it continued to be that of official correspondence in Bengal for many years. In the directions for revenue officers in the North-West Provinces, published in 1849, they are instructed to convert Oordoo and Hindee words into English according to an alphabet there given. This alphabet has the double *oo* and *ee* and the initial *U* for the Jonesian *A*. It is, therefore, on the Gilchristian system and in the same scheme as that adopted by the Record Committee in 1820. It is recommended as "that which an Englishman would naturally adopt, without aiming at great refinement or accuracy." Roughly speaking the system of Dr. Gilchrist was the one that enjoyed general official sanction throughout India down to the year 1868. (17) *Official measures in other provinces subsequent to 1868.*—In 1868 the Bombay Geographical Society made proposals to the Government of India for the preparation of a Vernacular and English index of Indian geographical names. The Government of India therefore invited aid from the local Governments in the preparation of such an index, and suggested the adoption of a uniform system of transliteration, at the same time drawing attention to Professor Wilson's modification of Sir William Jones' system. This work was not carried out. Dr. W. W. Hunter of the Bengal Civil Service, was appointed in 1869 to compile the Gazetteer of Bengal, and he was instructed to secure uniformity of spelling in the preparation of the other gazetteers at that time projected throughout India, the system of Professor Wilson being again recommended as a model. Dr. Hunter submitted a plan in which he recommended arrangements of the nature of a compromise. The scientific details of Professor Wilson were allowed to be too elaborate for general use. Diacritical marks therefore other than the acute accent were omitted. A number of accents were discarded which though properly belonging to the word were not considered necessary for purposes of pronunciation. Various other measures of compromise in the transliteration were adopted. A certain freedom was also to be allowed in spelling names which were familiar to the public, or had become historical, in a form based on a different system. Nevertheless, Dr. Hunter adopted the Jonesian or continental system of vowels without abatement. It is evident that this is not real transliteration, and that it gives a certain amount of play to phonetic considerations. But it is an approximation to transliteration. The difficulties in the way of thorough transliteration as applied to Indian names are described by Dr. Hunter in the note preceding his guide to the orthography of Indian Proper Names (1871), and in the preface to his Imperial Gazetteer (1881). In 1870 the Government of India approved, as he then formulated them, Dr. Hunter's plans for the spelling of the gazetteers. In 1872 the Secretary of State endorsed the measure, but suggested "that some extension should be given to that part of the scheme which permits a departure from the new system, in the case of those places of which the names have acquired a widely-recognized mode of spelling either from popular custom or in consequence of historical notoriety." Subsequently to this, the gazetteers of various provinces proceeded with the spelling of the geographical names conducted on Dr. Hunter's principles. Lists were also called for from the provinces showing names of principal

cal marks, and the table is therefore unsuitable for practical use. It is of service however as a standard. An analysis of the most simple transliteration under this style will be found in Vol. II, App. XXII; and Vol. II, App. XXIII, gives the same results in tabular form and as used for the purposes of this work. The Tamul, which is the principal language of this Presidency, does not lend itself to transliteration; the powers of the letters varying almost as much as they do in English. See the notes in Vol. II, App. XXVII. The portion of the table at Vol. II, App. XXIII, which relates to Tamul is therefore very imperfect. It is only offered as the best suggestion which seems practicable under the circumstances. In 1877 the Government authorized the spelling on the new system of 35 vernacular geographical names in frequent use in the Military department, and in 1879 that of 837 similar names in frequent use in the Revenue department. The Registration, Survey, and Archæological departments employ, though under no

geographical places transliterated in the same way. It is not known that any province has adopted measures for introducing continental spelling as a general system applicable to all classes of vernacular words; though that is evidently the only goal that can be logically aimed at, and the difficulties of a mixed style must meanwhile prevail. (18) *Official measures in this Presidency.*—The failure of the Madras Literary Society's proposals for a sudden conversion of the spelling style of the Presidency has been described above. The Government under Sir Charles Trevelyan endeavoured in the same year, 1859, by contracting those proposals to put them into orders and change the official style; but even the Government orders were too sweeping, and it was found impracticable to act upon them. They were never enforced. This Presidency having produced no gazetteer, the introduction of Dr. Hunter's plans for the spelling of geographical names has not taken place. The Government have passed occasional orders in connection with different works, but have substituted no plan of their own for Dr. Hunter's. They have prepared geographical lists as stated in the text. General orders on the spelling question are not yet passed. The steps necessary for such a course are apparently three:—first to frame a general standard which will embrace all the South Indian languages; secondly to extract thence tables for each language somewhat modified to suit the requirements of each; thirdly to prescribe various conditions under which such transliteration is to be employed. (19) *Summary of the above paragraphs.*—The question of the conflicting styles of spelling may be summed up as follows. The continental method has an undoubted superiority in cases where particular accuracy is required; as for scientific or philological purposes, or in transcriptions from the dictionary. The English style is sufficiently accurate for all ordinary purposes of identification. It has also the recommendation of being that to which all English people are accustomed; in fact the opposite is as much a foreign style to Englishmen as are the vernaculars themselves. As stated at the beginning of the note, if the continental style finally supersedes the English style, the reason will be that the English have surrendered that which is most natural to themselves in order to provide the literary machinery which is most suitable to India. With regard to official action, the Governments of other provinces have brought this question to an issue on the occasion of publishing their respective geographical gazetteers. This Government having published no gazetteer has not brought the matter to an issue. The endeavours made in the present volumes to elucidate the subject are tentative. (20) *General standard romanising alphabets.*—To complete the subject of Indian transliteration, it seems necessary to mention the general and universal alphabets which have been proposed in the same connection. Probably Indian transliteration is already sufficiently provided for, and these alphabets will have little influence in this country. But still it is to be observed that they are designed for application to all languages, including the Indian. The most noteworthy of these are the standard alphabet constructed by Professor Lepsius of Berlin, and Max Müller's Missionary alphabet. Lepsius' alphabet is remarkably full and ingenious, and is based on general scientific principles; but it is complex, and cannot be printed without special type. The Church Missionary Society however have recommended it to their missionaries for adoption, and Gundert's Malayalam Dictionary is transliterated on this system. Max Müller's alphabet is designed on the principle of avoiding niceties and employing printers' ordinary signs only, so that it can be set up anywhere. The following tabulation of this system will speak for itself. A special feature of the system is that italics indicate a modification of some type-letter, but do not distinguish between different modifications. It is not known that any use has been made of this system in Southern India:—

Roman letter.	Sound to which applied; specimen.	Roman letter.	Sound to which applied; specimen.	Roman letter.	Sound to which applied; specimen.	Roman letter.	Sound to which applied; specimen.
a	America	h	hand	ng	sinking	u	full

express orders, transliteration tables on this system, based primarily on the table shown in Vol. II, App. XXIV. The present volumes give the elements for determining the future orthography of all vernacular words belonging to the Presidency which occur in them; or about 8,000 words in all. The traditional English form as ascertained from the best authorities is here first recorded; excepting in certain cases, as for instance words used in a philological or scientific connection or mere transcriptions from the dictionary, where the new form is proceeded to direct. Secondly the transliteration on the continental system according to Vol. II, App. XXIII has been ascertained as accurately as possible by comparison with the original South Indian vernacular in which the words are most frequently found; and is set in a bracket by the side of the traditional form if such occurs, or in a bracket by itself if such does not occur. Thirdly where particular forms of geographical names have been authorized by the Madras Government, as above mentioned, these are distinguished by an asterisk; and similar forms authorized by the Government of the neighbouring province of Mysore (295 in number) are distinguished by a special entry. Except in the cases just mentioned no attempt has been made to indicate forms of spelling which should be adopted for actual use, a question which must be determined by practical considerations and particular requirements, or by future orders of Government. The procedure here mentioned has been adopted throughout the Glossary and Index with cross-references; and in the case of all lists contained in the work where that does not cause inconvenience. Attention having been given to the orthography of the portions of the volumes required for reference, the traditional spellings have been retained in the current texts without alteration. It is probable that in twenty years' time the difficulties which now attend a practical treatment of the orthography of the Presidency will have disappeared, the new style having superseded the old. But before that result is arrived at, there must be some consensus of opinion as to the treatment of the Tamul language. It must also be understood that accents are an essential part of the new style, without which it is inferior in perspicuity to the old. The native states of Travancore and Cochin transliterate on the English traditional method above described. The French at Pondicherry transliterate according to the genius of their own language; *ou* stands for *oo*, and the circumflex serves to indicate long vowels.

739. CORRESPONDENCE.—The literary institutions or libraries with which the Government are in communication in other parts of India, in Europe, or elsewhere, are shown in the list at foot.^[10]

CHAPTER VIII

INSTRUCTION.

BOOK REGISTRATION, &c.

740. INTRODUCTION.—Some remarks are given in the foot-notes [1, 2 & 3] on the history of South Indian typography, and present state of native printing-presses and agencies for publishing and selling books in the Presidency.

[1] SKETCH HISTORY OF DRAVIDIAN TYPOGRAPHY.—*Tamul*.—The first Tamul types were cut at Amsterdam in 1678, to express the names of some plants in the large work called "Horti Indici Malabarici." They were however very indifferent. The next attempt was made at Halle, about 1710, to supply the Tranquebar Mission. Fenger says:—"the people there, though unacquainted with the Tamul language, succeeded in making some Tamul letters, which they hastily tried and sent to Tranquebar; where the first part of the New Testament, as well as other things, was printed with them. This sample, the very first thing ever printed in Tamul characters, was the Apostles' Creed; and the friends... Halle, when they despatched it with the printing-press, requested soon to be requited by a copy of the New Testament in "Tamul." The printing of the New Testament was completed at Tranquebar in 1715. The type first cut at Halle is about equal to the size called English. Smaller founts were cut afterwards. Founts of type were subsequently cut in India. In 1761 the Madras Government allowed the Vepery missionaries the use of a press taken at Pondicherry. Tamul typography was much improved some twenty-five years ago by the American Mission Press in Madras. The smallest size (brevier) was on that occasion prepared in America. (2) *Teloogoo*.—Printing in Teloogoo was commenced about 1806, but there was not much done in it till 1830. The Gospel of St. Luke was printed in 1810, and eight years later the Serampore missionaries printed their Teloogoo version of the New Testament. The Madras Religious Tract Society commenced its Teloogoo series of publications in 1819, and the London Mission printed both in Teloogoo and Canarese at their press at Bellary, established in 1825. Much of the excellence of the present style of Teloogoo printing is due to the efforts of Mr. P. R. Hunt, the Superintendent of the American Mission Press, the larger series of Teloogoo type having been cut in Madras under his directions. The press of the Society for Promoting Christian Knowledge turns out good work in Teloogoo, and within the last year or two has completed an excellent fount of brevier Teloogoo type, the smallest in use. (3) *Canarese*.—Canarese typography has been brought to its present degree of excellence by the efforts successively of the London, Wesleyan, and Basel Missionary Societies. The first Canarese type was produced, for the purpose of printing the Bible, under the direction of the superintendent of the press established by the London Missionary Society in Bellary, in 1825, which continued in operation for many years. The Wesleyan Mission Press, subsequently established at Bangalore, but now closed, did much to perfect Canarese type; as also the Basel Mission Press at Mangalore, whose Canarese printing is unequalled for beauty by any other press in India. (4) *Malayalam*.—Among the earliest printed Malayalam books are the Malayalam-Portuguese and Portuguese-Malayalam dictionaries compiled by the Portuguese and Italian missionaries of Vepery, at which place they were printed in 1746. The "Pattam Pann" printed by the Rev. F. E. Hanzleden was probably prior to these dictionaries. After the destruction of the Roman Catholic establishment at Vepery by Tippoo, a printing-press was set up at Connemow, which supplied religious books for Malayalam Catholics. This press used vertical types. In 1810 a set of types was cast at Bombay, the form of the letters being copied from the palm-leaf writing. The Protestant Missions next turned their attention to printing. The Church Mission Society (which commenced work at Cottayam in 1816) commenced to print in 1820, its first production being the Gospel of St. Luke; the punches, type, &c., were made by the Rev. H. Bailey, with the aid of a native blacksmith. In 1839 the Vepery Mission Press of the Society for Promoting Christian Knowledge printed Mr. F. Spring's Malayalam Grammar. The types are long and incline to the left. The Basel Mission commenced work at Tellicherry in 1839. A lithographic press was set up in 1845 and continued to work till 1863. In 1863 Malayalam punches were cut at Stuttgart and the type cast at Mangalore, where it has been in use since that time. The London Mission (which commenced work in Travancore in 1806) printed Malayalam books; at first at Cottayam, but during the last few years at Nagarcoil. Native presses have also been at work for several years at Munjery (since closed), Calicut, Tellicherry, and Mattancherry in Cochin. Among their publications are the Mahabharat, Ramayana, Nalacharitam, Mshabbagavat, and Scandapoorana. The above presses print Malayalam in the Koleshoot alphabet. The Moplahs, on the other hand use Arabic letters. Their first press was a lithographic one set up at Tellicherry in 1863 or 1864. The smallest type used in Malayalam printing is long primer. The sizes in ordinary use are old and new pica, while double pica is used for titles.

[2] SKETCH ACCOUNT OF THE PRESENT STATE OF NATIVE PRINTING-PRESSES IN THE PRESIDENCY.—There are at the present time about sixty printing offices in the city of Madras, the property for the most part of Hindoos. These presses are mainly employed in the printing of job-work, that is to say circulars, bill-heads, forms, &c., for the use of mercantile firms; and in the production of Hindoo vernacular religious books, and the works of the most popular native author. Within the last fifteen years the old wooden press has given place to the more effective iron press, Columbian generally, of European manufacture. The plant of the larger number of these offices does not exceed Rupees 1,000 in value. In some few cases, however, the value ranges from Rupees 2,000 to Rupees 10,000. As a general rule the printing rates are exceedingly low. Bookbinding also is usually carried on at these presses. It consists generally of simple stitching or stabbing and paper covers, or common cloth back with fancy China paper sides. The charges are exceedingly low, ranging from half an anna to two annas a copy according to the size and thickness of the volume.

[3] SKETCH ACCOUNT OF NATIVE PUBLISHING AND BOOK-SELLING AGENCIES IN THE PRESIDENCY.—*Ordinary publishers*.—Of these there may be said to be four distinct classes. First the sons or near relatives of those eminent Tamul scholars, who in the early part of the nineteenth century laboured for the promotion of Tamul literature by printing and publishing standard works on poetry, grammar, rhetoric and religion, with learned commentaries. Publishers of this class are few in number and their issues are much below the average. Secondly there are workmen who were once employed as compositors, binders, &c., in printing establishments under European supervision. Some of these have succeeded in doing a publishing business and supplying in a limited degree the demand of schools and colleges or the requirements of the public at large. Thirdly may be named Tamul and Teloogoo pundits, who with or without

741. REGISTRATION.—The registration of books in this Presidency is regulated by India Act XXV of 1867. The intention of that portion of the Act which relates to book registration is to procure a complete list of the works published in the Presidency, together with a knowledge of their contents, and to effect this object the registration of books is rendered compulsory. All printers are required by section 9 of the Act to deliver within one calendar month, from the date of issue, to the officer appointed by the local Government to receive them, three copies of every book produced at their presses, together with a memorandum of particulars regarding each work as required by section 18. There is a Registrar of Books in Madras whose duty it is to collect, catalogue and preserve copies of all books printed in the Presidency town. In the case of books published in the districts of the Madras Presidency, the local Registrars of Assurances, who are in communication with the Registrar of Books, receive and transmit to him such books with the prescribed memoranda of particulars, for inclusion in his collection and catalogue. The printers are paid at published prices for the books furnished to the Registrars. The particulars contained in the printers' memoranda are entered in a register called the Catalogue of Books (section 18). The rules issued by the Government under section 20 of the Act for carrying out the objects of book registration were published in the Fort St. George Gazette of the 24th September 1867. The Registrar of Books compiles for publication in the Fort St. George Gazette quarterly catalogues of all registered works with a short statement of the contents of those of them, whose title pages do not give sufficient information, or which are works of importance and interest. Copies of all registered works are also sent by the Registrar monthly to the Government for transmission to the Government of India, while copies of those works only which, from a perusal of the quarterly catalogues, the Librarian of the India office may select for the Library, are transmitted to the Secretary of State for India. The Registrar further submits an annual analysis and review of the published literature of the Presidency besides other periodical reports called for by the Government, and such review is published with similar reviews from other Presidencies and administrations in an annual volume as "Selections from the Records of the Government of India," from which a tolerably correct acquaintance is obtained by the Administrations with the progress of literary effort during each year and particularly with the tendency of native publications. The note at foot gives an analysis of the publications registered during 1883. [4] The

pecuniary help from others, publish a limited number of works. These publications are in every respect superior to those printed by the other classes. Fourthly some natives who are otherwise employed own no presses but publish a few works. (2) *The Madras Vernacular and School Book Publishing Society.*—The most enlightened development of vernacular publication is shown in the work of this society. It was organised in the year 1820, about two years previous to the earliest measures of the Madras Government in the Department of Public Instruction initiated by Sir Thomas Munro. Its first object was the provision of suitable school-books of instruction for the use of native schools and seminaries, both English and Vernacular; and with this object it began the purchase, preparation and publication of useful works to be supplied to them either gratuitously or at a cheap rate. In this work it continued for some time until 1866 when its work was taken up by other and more recent agencies, especially the Government Department of Public Instruction and the Vernacular Education Society. It then directed its efforts principally to the creation and diffusion of a sound and instructive vernacular literature. The results of the latter are various publications in Tamil, Telugoo, Hindostany, Malayalam, and Canarese; and the Tamil and Telugoo "Janavinodiny" a monthly magazine of instruction and amusement. A Telugoo dictionary undertaken on a large scale is also nearly completed. From the commencement the depository of this society has been in the Old College, Nungumbaukum, Madras. At first the society was maintained by subscriptions and donations, mostly from Europeans employed in the service of Government. At a later stage it received an annual grant from Government. For several years past it has been self-supporting. Very recently it has undertaken the custody and sale of Government school-books. See the foot-note in the article on Government in connection with Literature. (3) *Price of native publications.*—This is extremely moderate, as may be inferred from the remarks made above with regard to printing. A tale or drama, containing about 100 pages, 8vo., half bound in cloth, is sold for about 2½ annas. Works which have a small circulation are however somewhat more expensive. (4) *Book-selling.*—The agencies for the circulation of native books are sufficiently effective. Vernacular books may be purchased in the bazaars of every town in the country. The printers generally sell their own publications. Many of them are taken by book-hawkers, though men of this class are frequently relatives of the printers. In Madras during the early part of the day, it is usual for book-hawkers to offer their wares through the towns; in the afternoon they resort to the market. The book-hawkers visit also the principal temples when feasts are held.

[4] *ANALYSIS OF PUBLICATIONS LATELY REGISTERED.*—The number of publications registered in this Presidency during the year 1883 was 818, of which 763 were books and pamphlets and 55 periodicals. The publications are grouped in accordance with four fundamental divisions: first as originals, translations, and republications; secondly according to the object with which they are written, that is, as educational or non-educational; thirdly according to the languages in which they are written; fourthly according to their subject-matter as biographies, dramas, &c. Under the first classification, there were 225 original works, 37 translations, and 556 republications. Under the second classification, 210 were educational works and 608 non-educational works belonging to the class of general literature. Under the third classification, 126 were books in English and other European languages, 584 books published in the Vernacular languages spoken in the Presidency, 58 books in Oriental classical languages, and 50 books published in more than one language. According to subject-matter, there were 4 works in English under the head of art; 7 works under the head of biography, of which 2 were in English; 29 dramatical works; 14 works of fiction, of which 1 was in English; 10 historical works, of which

non-delivery of publications to the Registrar is a penal offence on the part of the publisher; no prosecutions however have yet taken place. The publications exempted under section 21 from the provisions of the Act are given at foot.^[5] The rules having the force of law in connection with the subject of Book Registration are given in foot-note.^[6]

742. COPYRIGHT.—On the payment of two rupees after the delivery of books to the Registrar of Books, such entry with a note that the copyright has been registered secures the copyright of the work to the proprietor, and is viewed as an entry in the book of registry kept under India Act XX of 1847 (providing for the enforcement of copyright in British India). Before the Registration Act all entries of copyright under India Act XX of 1847 had to be made in the books of the Home department of the Government of India, being forwarded through the local Government. The registration of copyright is not compulsory; but the copyright of books published by private persons is frequently secured under the present arrangement. Unless the copyright is secured thus formally the author or proprietor will have no copyright. Anybody else may then publish the work with impunity and deprive him of his interest in his work, and no remedy can be had in a Court of Law. If on the other hand copyright is registered, the fact will be admissible as 'prima facie' evidence of title, and the registered proprietor can exercise the right to assign his interest or any portion of his interest in the book. Should any person print or cause to be printed any book in which there subsists copyright without the consent in writing of the proprietor, or have in his possession for sale or hire any book so unlawfully printed without such consent, such offender makes himself liable to a special action for damages, and all printed copies of such work are forfeited to the copyright proprietor. At one time it was not uncommon to print on the title page the words "Registered Copyright" and similar formulæ, even though the copyright had not been registered, but compliance with the law is now more general since an explanation of its provisions was, by order of Government, circulated among printers and publishers in 1875. It not unfrequently happens that the copyright of Government books is infringed. The question of amending the Indian Copyright Law in this particular is under consideration.

743. REGULATION OF PRINTING.—India Act XXV of 1867 also provides for the regulation of printing presses and of periodicals containing news. The keeper of any press for the printing of books or papers is required to make a declaration before a Magistrate to the effect that he is the keeper of a printing press. All books and papers must have printed legibly on them the names of the printer, publisher and places of printing and publication; non-compliance with this is penal.

744. LAW.—The law relating to copyright is contained in the following:—Statutes 3 and 4 Will. IV, c. 15 (1833 A.D.): Drama; 5 and 6 Vic., c. 45 (1842 A.D.): Copyright Act; 7 and 8 Vic., c. 12 (1844 A.D.): International Copyright; 10 and 11 Vic., c. 95 (1847 A.D.): Import of Reprints of Copyright Works; 13 and 14 Vic., c. 104, ss. 6, 7, 15 (1850 A.D.): Copyright of Designs; 15 and 16 Vic., c. 12 (1852 A.D.): International Copyright; 24 and 25 Vic., c. 67, s. 43 (1861 A.D.): India; 25 and 26 Vic., c. 68 (1862 A.D.): Copyright in Works of Fine Arts; 39 and 40 Vic., c. 36 (1876 A.D.): Foreign Reprints of Copyright Works; India Act XX of 1847 (Copyright); India Act XXV of 1867 (Printing Presses and Books Act); India Act I of 1877 (Specific Relief); India

6 were in English; 120 publications under the head of language, of which 17 were in English; 29 legal publications, 20 of which were in English; 22 under medicine, of which 4 were in English; 94 miscellaneous works, of which 21 were in English; 76 works under poetry, of which 1 was in English; 4 under politics, all of which were in English; 3 under philosophy, of which 2 were in English; 361—31 in English—under religion, of which 277 represent Hindooism, 146 Christianity, and 30 Mahomedanism; 13 under mathematical and mechanical science, of which 7 were in English; 30 under natural science, of which 6 were in English; and 3 under voyages and travels, of which 2 were in English.

[5] PUBLICATIONS EXEMPTED FROM REGISTRATION.—Acts of the Legislative Council without notes or commentaries; price lists and tradesmen's circulars; catalogues of books and other articles; auctioneers' notices and advertisements; play-bills, comprising advertisements of theatrical and musical entertainments; decisions of Courts of Law without notes or commentaries; petitions and appeals addressed to constituted authority under the provisions of law; testimonials of private individuals or public officers; annual reports of schools, banks, societies, and firms; almanacs and calendars; labels affixed to articles of commerce.

[6] RULES HAVING THE FORCE OF LAW.—Under India Act XXV of 1867, ss. 20 and 21 (Printing Presses and Books Act), the following have the force of law:—(1) Section 20, General rules—Educational Notification, dated 24th September 1867; Fort St. George Gazette, dated 18th October 1867. (2) Section 21, Exclusion of certain class of books from the provisions of the Act—Government of India, Home Department Notifications, Gazette of India, 23rd December 1871 and 17th August 1872.

Act XV of 1877 (Limitation); India Act VIII of 1878, s. 18 (Sea Customs); India Act I of 1879, sch. II, No. 5 (Stamps); India Act XV of 1882, s. 19 (n), (Presidency Small Cause Courts). The detailed law relating to books in this connection is shown under the head of "Books" in Vol. II, App. LIV.

745. STATISTICS.—The table at foot [7] shows the number of books simply registered and of those of which the copyright was secured during the last ten years.

MADRAS MEDICAL COLLEGE. &c.

746. MEDICAL COLLEGE.—The Madras Medical College, which was established in the governorship of Sir Frederick Adam in 1835, was originally a school of medicine in which medical subordinates were trained for the public service, but it now also trains students for medical degrees of the Madras University. It is under the general control of the Director of Public Instruction, the Surgeon-General being ex-officio visitor. The college consists of two departments. In the senior or University department, the students qualify for the technical M.B. (Bachelor of Medicine) and C.M. (Master in Surgery) degrees of the Madras University by five years' study, and for the L.M.S. (Licentiate of Medicine and Surgery) degree by four years' study. The qualification for entry to this department is that candidates for the former degree must have passed the First Examination in Arts, and those for the latter degree the Matriculation Examination of the University. A scale of fees has been laid down for admission of students in either of the sections of the first department. The second department is for military hospital apprentices qualifying for employ as military apothecaries, and civil hospital apprentices qualifying for employ as civil apothecaries under Government or local boards; the test for entry being a competitive examination in the former case and the University Matriculation Examination in the latter. The training given in this is equal to that undergone by students qualifying for the L.M.S. degree. Female students, of whom there were altogether 10 in 1883-84, may belong to either of these two departments. The entrance examination to the second department for female candidates is the Higher examination for women. A junior or third department formerly consisted of military native medical pupils qualifying for employ as military hospital assistants, and civil medical pupils qualifying for employ as civil hospital assistants under the Government or local boards. This department ceased to exist in 1883, and the pupils who constituted it were transferred to the Royapooram Auxiliary Medical school next to be mentioned. The figures at foot [1] give the

strength of the two existing departments of the college for the last four years. The academical year extends from 1st October to 30th June inclusive, and is divided into a winter term of six months ending on the last day of March, and a summer term of three months ending on the 30th June. The annual examinations of the college are held in June. The college has a good medical and anatomical museum, besides a museum of botany and materia medica. It has a laboratory in which practical chemistry is taught, and there is a separate building for the study of practical anatomy. It has also a library, which is supplied annually with a selection of professional works. The teaching staff consists of a principal and professor of medicine, ten professors and four assistant teachers. The technical course of education consists of anatomy, botany, chemistry, pharmacy, physiology, materia medica, surgery, practice of medicine, hygiene, midwifery and diseases of women and children, diseases of the eye, comparative anatomy, medical jurisprudence, dental surgery, and pathology. The lectures in chemistry, botany, physiology, medical jurisprudence, hygiene, organic chemistry, comparative anatomy, practical chemistry, and practical pharmacy are also open to the public on payment of certain stipulated fees. In connection with these lectures there is a class for students who wish to become qualified as chemists and druggists. The attendance at lectures delivered here is recognized in Great Britain as part qualification for degrees in that country. The students obtain clinical instruction in medicine and surgery, &c., in the military and civil hospitals at Madras. The next table [2] exhibits the income and expenditure of the college for the last four years.

747. AUXILIARY SCHOOL.—The Auxiliary Medical School at Royapooram was established in 1877 to meet a deficiency in the strength of the Subordinate Medical establishment during the Madras Famine. The school was affiliated to the Medical College in 1879. In 1883 the Government abolished the junior department of the Medical College, as above mentioned, and established the school as a permanent institution for the education of hospital assistants. The teaching staff consists of a superintendent and professor of medicine and surgery and five lecturers. The test for entry to the grade of hospital assistant is a competitive examination. The students attending the school are divided into three classes. They must undergo a course of three years' training before they can be found qualified for the grade of "hospital assistant." The academical year extends from the 1st October to the 30th June, and is divided into a winter session of six months and a summer session of three months. The annual and final examinations are held in June. The students receive clinical instruction in the Native Infirmary at Royapooram and the Lying-in Hospital attached to the Monigar Choultry. There were 86 students in this school in 1883-84. The school was worked in the same year at a total cost of Rupees 15,325-12-8, the fees amounting to Rupees 702.

AGRICULTURAL COLLEGE.

748. NATURE OF THE INSTITUTION.—This institution [1] situated at Sydapett is attached to the Educational department and placed under the direct management of a principal who is assisted in lecturing by officers of the Madras Medical College and others. The instruction extends over three years, and embraces a thorough

[1] SKETCH HISTORY OF THE AGRICULTURAL COLLEGE.—Between the first opening of the Experimental Farm at Sydapett and the end of the year 1875 several apprentices joined that institution, an apprentice meaning here a student drawing from the institution a small stipend. These apprentices were either Eurasians or Hindoos, the former generally the sons of old soldiers resident at Pallavaram or St. Thomas' Mount. In establishing this class, the intention was

study of agriculture and of such portions of chemistry, geology, zoology, botany, and the veterinary art as bear on the theory and practice of agriculture, farm book-keeping, land surveying, mensuration and drawing. The students, before admission, must have passed the Matriculation Examination or the Middle School Examination, or the special entrance examination of the institution. Candidates must be above 16 and below 24 years of age. A considerable number of stipendiaryships have also been established, and the regulations provide for the gratuitous admission of school teachers and others to certain special courses of lectures. Judging from the number of applicants and the qualifications of the present students there are grounds for believing that it will amply fulfil the object for which it has been established. Nearly all the chief Native States have sent students to the college. Most of the passed students are employed in connection with agriculture; some hold very responsible situations. There are now in the college upwards of 100 students, consisting of Europeans, Eurasians, Hindoos, Mahomedans, &c., most of whom are connected with the land as owners or occupiers. The annual cost of the institution is about Rupees 40,000.

CIVIL ENGINEERING COLLEGE.

749. CONSTITUTION.—This institution [1] at present consists of (1) a collegiate branch or “First Department,” educating commissioned officers of the army and members of the Madras or other Indian Universities who have passed the “First Arts” Examination, to the standard required for Assistant Engineers, Public Works department, the course being also adapted to meet the demands of the degree of Bachelor of Civil Engineering conferred by the Presidency University; (2) a school branch, training students of all classes for the various grades of the upper and lower subordinate and of the office establishments of the Public Works department; this comprises (a) Second department which educates European non-commissioned officers and soldiers and civilians of all races to the standard required for the grades of Supervisor and Overseer, Public Works department, (b) Special surveying class, which fits men to become practical Surveyors, and (c) Special drawing class, which trains to the standards required for Draftsmen and Estimators in the Public Works department; (3) an officers’ surveying class; this class has for some years been in abeyance owing to the establishment of garrison courses of instruction, and it is not likely that it will be revived. Owing to the recruiting of the Engineer establishment of the Public Works department from the Officers of Royal Engineers and from the Civil Engineers educated at the Royal Indian Engineering College, Cooper’s Hill, no students have joined the military division of the first department since 1870. The civil division of the first department is generally well filled, notwithstanding the difficulty passed students have hitherto experienced in obtaining employment suited to their acquirements and capabilities. Although the system of appointing qualified natives as Engineers has met with success in the other provinces of India, only three Madrassees have been nominated to the Engineer establishment of the Madras Public Works department during the past twenty years. Many, it is true, joined the subordinate branch of the service;

merely to afford an opportunity to a few young men to make themselves acquainted with the routine out-of-door duties of the farmer. In 1871, in order to provide the necessary agency for carrying on the district farms, another apprentice class was established. This second class was better paid and was established in view to training superintendents for the district farms. The young men of both classes came to the farm ignorant of agriculture, and as the training was entirely out-of-door and mechanical, they made but little progress towards gaining a real knowledge of this subject. As it appeared to be established that youths trained under such a system could not be usefully employed in the districts in spreading agricultural knowledge, or in conducting agricultural operations of any complexity, it was decided in 1876 to establish a school of agriculture at Sydapett. The work of the institution has been going on now for eight years and a large number of students have gone through the course, of whom 59 have obtained the first-class certificate and 28 the second-class. Buildings for the college have been provided, also a chemical laboratory, a veterinary hospital, a botanical garden, and it is intended to open a college farm.

[1] SKETCH HISTORY OF THE CIVIL ENGINEERING COLLEGE.—With the view of training men for service in the Revenue department, a Government Survey school was established in 1834, which was developed some twenty-five years later into a Civil Engineering school to meet the requirements of the Public Works department. In 1861 a special class for surveying, drawing, and estimating was formed, and in the following year the institution became a college by the addition of a senior department for the supply of Engineers. About the same time an officers’ surveying class was also added.

but the college attendance became extremely small during the years 1880 and 1881, and the present full classes are to be attributed partly to the demand for Engineers by Local Fund Boards, Municipalities, &c., but mainly to the expectation that the policy of the Imperial Government of extending the employment of natives generally will result in a portion of the first appointments to the Engineer grade in the Government service being thrown open to competition in India. In the event of one appointment per annum being guaranteed to the Madras College, there is little doubt that fair classes might be found consisting entirely of graduates of the University. The course of study in the first department extends over a period of two years, and embraces instruction in mathematics, pure and applied, engineering design and construction, architectural and topographical drawing, and surveying and levelling. The session commences in January and terminates in December, when a final examination is held by independent examiners for the award of certificates as Assistant Engineer. The University examination for the B.C.E. Degree takes place in the following January. The second department is composed of non-commissioned officers and soldiers of British regiments and of civilians. University matriculates are eligible for admission without examination; but all other candidates undergo an entrance examination in arithmetic and English. The successful military candidates, whose number is limited to five annually, proceed to Bangalore for one year to acquire a knowledge of vernacular language, after qualifying in which their admission to the college is confirmed, and they continue their studies in Madras in company with the civil students. The matriculates and other successful civilians join the college early in August, and remain under instruction for a year and ten months. The course embraces the subjects taught to the Engineer class, with vernacular language added; but the standard aimed at is of a more elementary character. The session terminates in May, when a final examination is held by independent examiners for the award of certificates as Supervisor and Overseer, Public Works department. The Public Works department selects such of the passed men as it requires, confirming them as members of the regular establishment after a year's probation on works; and the remaining certificate-holders generally secure employment under Local Fund Boards, Municipalities, &c. Admission to the special department or surveying and drawing classes takes place in the same manner as to the second department; but the standard of entrance examination is somewhat lower. The sessions are also the same, but the course comprises surveying and levelling only for the surveying class, and plan-drawing and estimating only for the drawing class. The final examinations are held by the college staff, and certificates as Surveyor or Draftsman awarded. Successful students find employment in the Public Works department, the Local Fund Boards, and Revenue Survey, Railways, and elsewhere. The classes are not at present as large as they might be, a result attributable partly to the small salaries offered to Draftsmen, and to the temporary nature of the work usually open to Surveyors. Instruction in photography is given to a few students selected from the different classes, and the advantage is eagerly sought after. The college has a library of about 2,000 volumes, chiefly technical works; and a model room whose contents are liberally used in engineering and drawing instruction.

750. STAFF.—The supervising staff consists of a Principal (who must be a military officer) and Professor of Engineering; one Professor of Mathematics; one Instructor in Engineering and Mathematics, who is also Librarian, Storekeeper and Superintendent of military students; two Instructors in Surveying and Drawing, one of whom also teaches Photography; one Instructor in Surveying; one Instructor in Drawing; two Pundits; one Native Bricklaying Instructor. The military students are under the command of the Principal, and reside in barracks at the college. They draw stipends of Rupees 10 each per mensem from the Educational department in addition to their pay, rations, clothing, &c., which they receive from the Military department.

751. FINANCIAL.—Five scholarships of Rupees 15 each per mensem for the second department, five of Rupees 8 for the surveying class, and five of Rupees 8 for the drawing class are tenable during the second year of study by the most proficient students of the respective classes. The "Walker" Scholarship of about Rupees 13 per mensem is tenable biennially for two years by a native of the west

coast districts only. Free studentships are open to boys of the Lawrence Asylum, and to others at the discretion of the Principal, up to a limit of five per cent. on the number of paying students as a maximum. The fees paid by the first department are Rupees 16 per mensem, and by the second and special departments, Rupees 3 per mensem. All the final examinations for certificates are open to independent candidates on fee payment. In 1873 the college was transferred from Imperial to Provincial Services, and a grant of £4,304 (equivalent to Rupees 51,648 at 1s. 8d. exchange) made as compensation. From the table at foot [3] it may be seen that, deducting fees, the average annual cost of the institution during the last five years has been Rupees 34,568.

EXAMINING BODIES.

752. BOARD OF EXAMINERS.—The present Board [1] consists of a President, who is usually a member of the Board of Revenue, and a certain number of ex-officio and special members. The ex-officio members are the Translators to Government and certain officers of the Survey and Settlement departments, while the special members are appointed at the pleasure of Government. Except for the tests in Hindostany and Persian for Military officers and the Translation tests of the

[1] SKETCH HISTORY OF THE OLD COLLEGE AND BOARD OF EXAMINERS.—By notification, dated the 1st May 1812, the Board for the College of Fort St. George was constituted. There is nothing to show who were the predecessors of this institution. The College Board held office first in Sullivan's Gardens, St. Thomé; next in Anderson's Gardens, Nungumbankum; and lastly from 1827 in the College Hall premises, Nungumbankum. The work of the Board consisted—(i) "in expediting and perfecting the preparation of candidates for those important public offices which the members of the Civil Service are destined to fill;" (ii) in supervising the instruction of Moonshes; (iii) in supervising the instruction of persons to be appointed Hindoo and Mahomedan Law officers in the various courts; (iv) in bringing out works in the Oriental languages and certain other special subjects and in working the College Press; (v) in keeping up a dépôt or library for the sale and loan of Oriental works; and (vi) in having in charge the Library of Oriental MSS. transferred from the Museum of the Madras Literary Society. In November 1826 the services of a portion of the members of the Board were dispensed with, and the Committee of Public Instruction appointed to carry out a system of native education was incorporated with the Board, the combined body being termed the "Board for the College and for Public Instruction." In May 1836 the connexion between the College Board and the Committee for Public Instruction was dissolved, the Board reverting to its former duties; the establishment kept up for instructing Law officers was discharged; and the staff of Moonshes alone was retained for the instruction of Junior Civilians in the Oriental languages. In July 1854, the College of Fort St. George was abolished and a Board of Examiners was constituted, which was also to perform the duties of a Central Committee for the Examination of Assistants. Revised rules for the examination of Assistants were published in 1854, and further revision was carried out in 1854 and 1859. In 1856 the Board was assigned the duty first of prescribing tests for the examination of Deputy Collectors, who were then about to be appointed, and secondly of prescribing tests for admission to the Uncovenanted Civil Service. The tests for Deputy Collectors were not introduced, but those for the Uncovenanted Service were introduced, and examinations were held by the Board from November 1858 to 1861 when the Director of Public Instruction was appointed Commissioner. In 1861 the Library of the Board of Examiners was amalgamated with the Government Central Book Dépôt. In 1862 the charge of the College Hall premises was transferred to the Director of Public Instruction. In January 1867, the Board of Examiners was abolished and a Committee for the Examination of Assistants was constituted. The staff of Moonshes was also dispensed with, and the Library of Oriental Manuscripts was transferred to the Director of Public Instruction. Such of the Board's records as it was desirable to retain were then lodged in the Government Office; the remainder were destroyed. The Committee for the Examination of Assistants now in its turn no longer exists, its designation having been changed again to "Board of Examiners" in January 1883.

Uncovenanted service, the Board conducts all the language examinations of the Presidency and a very large proportion of the departmental examinations in different departments. The examinations in Oriental languages conducted by the Board are held in January and July. Candidates for tests not above the military higher standard and second-class tests are examined either by the Board at Madras or by district committees, while those for the higher examinations in languages are invariably examined in Madras. The Translators to Government examine unaided for the lower tests, but for the higher tests they have the assistance of a scholar of reputation who receives a fee of Rupees 50 if not in the public service. The examinations conducted by the Board may be arranged as follows:—(a) Examination of Covenanted Civilians in all the prescribed languages and according to the standards' examinations; (b) examinations of Uncovenanted officers in the vernaculars under the rules published in the Fort St. George Gazette of the 11th November 1879; (c) examination of officers of the Educational Department, according to the high proficiency and honors tests for Civilians; (d) examination of Forest officers in the vernaculars; (e) examination of Police officers, Forest officers, and Cantonment Magistrates in law; (f) examination of Political officers by a special departmental test; (g) examination of all Military officers, including Medical officers and Chaplains in the prescribed languages excepting Hindostany and Persian; (h) examination in Hindostany of all officers in Civil employ; (i) examination in special languages, such as Ooriyah and Khond; (j) examination in special cases of candidates for the public service; (k) examination of officers under the orders of the Madras Bank and in Railway employ; (l) examination in Hindostany and other languages of officers in civil and military employ beyond the limits of the Presidency.

753. The following are further particulars regarding the above twelve heads:—(a) The Board tests Junior Civilians on arrival in the vernacular languages studied by them in England, and in conjunction with district committees examines Covenanted Assistants in January and July by the departmental examinations styled the lower and higher standards. The languages for these tests are, first the language of the district, and secondly any vernacular that may be selected including Hindostany and Ooriyah. In 1882 the Civil Account Code was added to the lower standard test; and the Civil Account Code, Revenue Survey, and Revenue Settlement to the higher standard. The Board also conducts the high proficiency and honors examinations for Civil Servants who wish to obtain distinction in languages. The languages for these tests are the four Dravidian vernaculars, Hindostany, Sanscrit and Persian. There is no test in Ooriyah beyond that for high proficiency, but there is a special test in Ooriyah for Civilians serving in Ganjam and Vizagapatam. When a Civilian has passed the high proficiency examination the Board grants a special certificate, and when the honors examination has been passed a diploma is given by the Governor in Council. (b) The Board also conducts the compulsory and voluntary examinations in the vernaculars for European and Eurasian officers in the Uncovenanted service. These officers are divided into three classes. The first class consists of officers holding appointments usually held by Covenanted Civil Servants. The rules for the examination of these officers is the same as those for Covenanted Civil Servants. The second class consists of Subordinate Judges, Deputy Collectors, and District Moonsifs. These officers have to pass the second-class test, which is compulsory, in the language of the district, before entering upon their duties after appointment or within one year thereafter. After passing the compulsory test these officers can go up for the high proficiency test in Tamul, Teloo-goo, Malayalam or Canarese, obtaining a reward of Rupees 1,000 if successful. The third class consists of officers in the Police, Jail, Revenue Survey, Revenue Settlement, Public Works, Farm, and Civil Medical departments, and officers in all other departments holding corresponding positions to whom a knowledge of a vernacular language is considered necessary for the efficient performance of their duties. These officers are examined in Tamul, Teloo-goo, Canarese and Malayalam by the third-class test, which is compulsory. After passing the third-class test they are permitted to go up for the second-class test already mentioned. The second-class test is purely a voluntary test for officers in the third class, and for passing which they obtain a reward of

Rupees 500. (c) Europeans and Eurasians serving in the Educational department, from the graded list down to Masters of Second-grade Colleges and Deputy Inspectors of Schools are examined by the Board according to the high proficiency test. This is a purely voluntary test for these officers, the compulsory departmental test being conducted by the Director of Public Instruction. The Board also examines educational officers of the graded list, who alone are permitted to appear for it, by the honors test for Civilians. (d) Conservators, Deputy and Assistant Conservators of the Forest department are examined by the Board according to the lower and higher standard vernacular tests for Assistant Collectors, Tooloo being an additional language in their case. The subordinate officers of the Forest department, if Europeans or Eurasians, are examined by the third-class test for Uncovenanted servants. (e) In conjunction with the same district committees the Board also examines Police officers, Forest officers, and Cantonment Magistrates in law; (f) and Political officers by a special departmental test laid down in 1800. (g) Commissioned Military, Warrant and Non-commissioned officers and privates, Medical Commissioned officers, Chaplains and Military Medical subordinates are also examined by the Board in the various languages named in the Army Regulations except in Hindostany and Persian, the examinations in which are conducted by a military examining committee. These are all examinations for rewards. (h) Military and other officers in civil employ are examined in Hindostany according to the lower and higher tests in addition to officers of the Postal, Telegraph, Topographical Survey, Trigonometrical Survey, Geological Survey, Marine Survey, and Accounts and Paper Currency departments, whose examinations, however, whether in Hindostany or a vernacular language by the higher standard, are made special cases. Medical officers who are District or Zillah Surgeons are also examined in Tamul, Teloo-goo, Canarese, and Ooriyah by two tests, the colloquial and the higher standard, the latter being the military higher standard test. (i) The Board also arranges for the examination of Military officers in civil employ and officers of the Engineering and Police establishments when serving in the Ganjam or Vizagapatam district in Ooriyah, and of European and Native officials serving in any district in the Khond language. (j) Persons who are desirous of entering certain departments are examined under the special orders of Government in the vernacular tests applicable to those departments. (k) Railway officers are examined in Tamul and Teloo-goo by a special test which is equal to the third-class test for Uncovenanted officers; and Agents and Accountants of the Madras Bank are examined in the language of their districts, or in Hindostany, according to a colloquial test which is called the Bank test. (l) The Board also arranges with military examining committees beyond the limits of the Presidency for examinations in Hindostany and other languages of officers in civil and military employ.

754. MILITARY EXAMINING COMMITTEES FOR LANGUAGE.—The examinations conducted in this Presidency under the immediate control of the military authorities (except those of a purely military nature which commissioned officers are required to pass for promotion to higher rank) are styled respectively the "Lower Standard," the "Higher Standard" and the "High Proficiency" tests, and are limited to the Hindostany and Persian languages. The vivâ voce portion of the lower and higher standard tests in Hindostany are conducted at up-country stations by committees of military officers appointed from time to time; the former examination is held on the first Monday of every alternate month; the latter on the 20th January, April, July, and October, or when that date falls on a Sunday, on the Monday immediately following. When it is possible to conduct the lower and higher standard tests in the Persian language in accordance with the provisions of clauses 79 and 194 of India Army Circulars of 1882, the vivâ voce portion of these examinations is held at an up-country station, but not on a fixed date, because the number of officers who are qualified to conduct such examinations being very small, it is found expedient to take advantage of the presence of such an officer in a station where a candidate may desire to present himself for examination. In all cases the committees submit a report on the results of the vivâ voce examination to the Examiner in Hindostany for final disposal. On the first Monday of every month the Examiner in Hindostany conducts the written examinations in all the tests in both languages. A reward of Rupees 180 is given for passing the lower

or higher standard test in Hindostany or the lower standard test in Persian. A candidate who passes the higher standard test in Persian obtains a reward of Rupees 500; while rewards of Rupees 1,000 and Rupees 2,000 are given to candidates who pass the high proficiency tests in Hindostany and Persian respectively. The lower and higher standard tests in Hindostany are obligatory on an officer who seeks admission into the Indian Army and for certain staff appointments. The object of the other tests is to encourage the study of Oriental languages. For any examination in Arabic, as also for the honor test in Hindostany and Persian, officers must proceed to Bombay.

755. COMMISSIONER FOR THE UNCOVENANTED CIVIL SERVICE EXAMINATIONS.—The Commissionership for Uncovenanted Civil Service Examinations^[2] instituted in 1860 was then entrusted to the Director of Public Instruction. There has been some subsequent changes, but the same officer at present holds it. The correspondence of the Commissioner is carried on by a Secretary. For the examinations he appoints examiners paid out of the fees. All the examinations prescribed for entry into the various departments of the Uncovenanted service are conducted by the Commissioner, besides others intended for schoolmasters and pupils. Of these examinations, the Middle School Examination is held on the 1st December and four following days. The Special Tests are held in May. The examinations for the grades of Civil Hospital Apprentice and Civil Medical Pupil are held whenever candidates are required for the Civil Medical Department. The rest of the examinations mentioned are held in December. All these examinations are held at a very large number of centres in the Presidency and at others also in Mysore and Travancore. The examinations conducted by the Commissioner may be arranged as follows:—(a) the Middle School Examination which includes the modified General Test; (b) the Special Test Examinations; (c) an examination of candidates for the grade of Civil Hospital Apprentice; (d) an examination of candidates for the grade of Civil Medical Pupil; (e) the Special Upper Primary and the Higher Examination for Women; (f) an examination of Matriculated candidates in Handwriting; (g) examinations in general education of candidates for schoolmistresses' certificates of the first and third grades and for schoolmasters' certificates of the fifth grade.

756. The following are further particulars regarding the above seven heads: (a) In 1879-80 when the Middle School Examination of the Educational department was instituted as a test of the fitness of the pupils of the highest (upper fourth) class in middle schools to pass into the lowest (fifth class) of a high school, it was decided to utilize it as a standard of general knowledge requisite for employment in the public service also, and thus supersede the "General Test." The scheme of the examination was accordingly so framed as to admit to the examination non-pupils and those knowing no English but wishing to qualify for admission to Government service or for teacherships of the lower grades. The rules, with all the latest amendments, are published in a Supplement to the Fort St. George Gazette of the

[2] SKETCH HISTORY OF THE UNCOVENANTED CIVIL SERVICE EXAMINATIONS.—The Uncovenanted Civil Service examinations owe their origin to the Educational Despatch from the Court of Directors, dated 19th July 1854. This despatch while authorizing the Government of India to establish a liberal system of education throughout India, approved of the institution of examinations for testing the fitness of candidates for offices under Government. The discussion of details occupied considerable time, but a scheme of examination for all Government appointments in this Presidency above the grade of peon was at last promulgated in March 1858, when for the purposes of the examination the Uncovenanted Service was formed into two divisions, the first including all appointments, the salary of which exceeded Rupees 50 per mensem, and the second all appointments below that grade and above the grade of peon. The examination standards of the various departments at that time are given in full in Appendix F of the Madras Educational Report for 1858-59. The examinations just mentioned were for a short time held under the direction of the then Board of Examiners. No fee was required, and the consequence was that more examinees came forward than could be provided with proper accommodation or could have a reasonable prospect of success. Copying and other malpractices could not be prevented. In order to reduce the number of examinees to more manageable proportions the Government, in an order of the 11th October 1860, authorized several modifications to be made in the examination scheme, amongst which were the exemption of all appointments of Rupees 25 per mensem and under from the operation of the rules, and the exaction of a fee. The management of these examinations was at the same time transferred to a Commissioner, and the test became that long known as the "General Test." The General Test was an elementary examination in Language, Handwriting, Spelling, Arithmetic, Indian History, and General Geography. It was divided into three branches, according as the candidate elected to pass in Handwriting, Composition, and Orthography, in English or in a Vernacular language, or in both. The appointments in the public service were (and still are) similarly roughly classed in a corresponding manner (though there is no schedule giving a precise definition) into English, Vernacular, and Anglo-Vernacular appointments; a candidate for any of these appointments should pass in the corresponding branch. In 1879-80 the General Test Examination was held for the last time, and, up to that time, 3,017 candidates had been declared qualified for the public service according to the Anglo-Vernacular branch, 4,284 according to the English branch, and 3,647 according to the Vernacular branch of the test.

15th January 1884. Under this scheme private candidates (i.e., those wishing to qualify for Government service) are examined in the same papers and at the same time as other pupil-candidates for the Middle School Examination in Handwriting, Orthography, Grammar, Composition or Translation, Arithmetic, Geography, and Indian History, and any two of the following:—Mathematics, Introduction to Science, Physical Geography, Astronomy, Botany, Physiology, English History, Agriculture, and Political Economy. To qualify for Government service a candidate is required to pass in the first class and to gain a higher percentage of marks in Handwriting, Dictation, and Arithmetic than pupils have. The annual average number of candidates appearing for the Middle School Examination is 7,500, of these 5,900 are school pupils and 1,600 private candidates. (b) The present Special Test Examinations were instituted for the purpose of testing the fitness of candidates for particular situations demanding special qualifications, and the first examination of this nature was held in March 1863 in subjects relating to the Judicial and Magisterial departments. The Revenue Tests came into force in 1864. The original rules bear date the 4th February and 30th May 1862; later on these were revised, and the rules were again superseded by those published under date the 29th July 1869. The latter remain in force with certain slight alterations. A list of the various special tests and the appointments for which they qualify is given in the foot-note.^[3] Under the rules no persons are admitted to any of the Special Tests except those who have passed the late General Test, the Middle School Examination—First Class—or the University Entrance Examination supplemented by a test in handwriting, but exceptions are sometimes made under the authority of

[3] LIST OF SPECIAL TESTS.—(1) Judicial Test—Civil, Higher Grade called I-A—offices: Subordinate Judge; District Moonsif. (2) Judicial Test—Civil, Lower Grade called I-B—offices: Sheristadar in the High Court (Appellate Side), District Courts, Subordinate Judges' Courts; Chief Clerk or Manager, Egmore Police Court; Head Writer in District Courts and Subordinate Judges' Courts. (3) Judicial Test—Criminal, Higher Grade called II-A—offices: Subordinate Judge; District Moonsifs; Deputy Collector and Magistrate; Subordinate Magistrate of the first class; Chief Clerk or Manager, Egmore Police Court. (4) Judicial Test—Criminal, Lower Grade called II-B—offices: Tahsildar and Second-class Sub-Magistrate, Talook Sheristadar and Second-class Sub-Magistrate, Second-class Sub-Magistrate and Deputy Tahsildar, Second and Third Class Sub-Magistrates; Sheristadar in the High Court (Appellate Side), District Courts, and Subordinate Judges' Courts; Police Inspector; Head Writer in District Courts and Subordinate Judges' Courts. (5) Revenue Test—General, Higher Grade called III-A—offices: Deputy Collector and Magistrate; Uncovenanted Assistant in the Office of the Board of Revenue; Sheristadar to the Board of Revenue. (6) Revenue Test—General, Lower Grade called III-B—offices: Huzoor Sheristadar; Second-class Sub-Magistrate; Tahsildar and Deputy Tahsildar; Talook Sheristadar; Sub-Collector's Sheristadar and Head Clerk; Head Assistant's Head Clerk; Abkarry Superintendent and Deputy Superintendent, Madras. (7) Revenue Test—Salt department called IV—for officers of the Salt department. (8) Revenue Test—Sea Customs department called V—offices: Superintendent of Sea Customs; Assistant Superintendent of Sea Customs when the salary of the office amounts to Rupees 50 per mensem or more. (9) Account Test—called VII—offices: Accountant in the Board's office; Accountants in the English department of Collectors' offices drawing salaries of Rupees 50 and upwards; Accountant, Marine office; Accountant in the Sea Customs office; Accountant in the Stamp office; Accountant in the Office of Conservator of Forests. (10) Translation Test—Higher Grade called VII-A—offices: Translators and Interpreters in the High Court and District Courts; Interpreters in the Court of Small Causes, Madras, Office of the Commissioner of Police, and Police Courts. (11) Translation Test—Lower Grade called VII-B—offices: Subordinate Judge; District Moonsif; Deputy Collector and Magistrate; Translators in Offices of Government, Board of Revenue, Office of the Director of Revenue Settlement and Collectors' offices; English Record-keeper in Collectors' offices; Sub-Collectors' Sheristadar, Head Assistant's Head Clerk; Head Writers, District and Sessions Courts and Subordinate Judges' Courts; Head Clerks, Small Cause Courts; Head Clerks in Police Courts and Assistant Head Clerk, Egmore Police Court; all the other offices designated under I-B, II-A, II-B, III-A, III-B, and IV and Registrar, Deputy Registrar, Examiner, Record-keeper or Clerk in the correspondence department of any Court other than the High Court drawing salaries of Rupees 50 and upwards, in case the candidate has not passed in the vernacular language of the district in which he seeks employment in an examination of the Madras or other University. (12) Précis-writing—Higher Grade called VIII-A—offices: General—First, Second, and Third Assistants, Registrar, Record-keeper, Head Examiner in the Press department, Deputy Registrar, Indexer, Examiner, Head Clerk of the Reference Branch, Head Clerk of the Petition department, and Head Clerk of the Pension department in the Government office. Judicial—Subordinate Judges; District Moonsifs; Sheristadar, Manager, Record-keeper, Examiner of Correspondence and Indexer of the High Court, Appellate Side; Sheristadar in District and Session Courts and Subordinate Judges' Courts; Head Writer in District and Sessions Courts and Subordinate Judges' Courts; Manager, Record-keeper, and Examiner, Madras Small Cause Court; Head Clerks in Small Cause Courts; Examiner and Record-keeper in all the Courts; Book-keepers and Head Auditor in the Office of the Inspector-General of Police; Manager in the Office of the Commissioner of Police; Manager, Egmore Police Court, Madras; Record-keepers in the Police Courts, Presidency; Manager, Government Agency, Vizagapatam. Revenue—Head Sheristadar, Uncovenanted Assistants, Registrar, Deputy Registrar, Local Fund Manager, Manager of the Forest department, First, Second, Third and Fourth Accountants, Record-keeper, Indexer, Head Translators, and Head Accountant of the Local Fund department in the Office of the Board of Revenue; Manager, Indexer, Examiner, and Record-keepers in the Office of the Director of Revenue Settlement; Deputy Collector and Magistrate; Huzoor Sheristadar; Sub-Collector's Sheristadar; Tahsildars; Sub-Magistrates; Abkarry Superintendent, Madras; Manager and Accountants drawing salaries of Rupees 80 per mensem and upwards in the Sea Customs office, Madras; Accountant, English department, Collector's office; English Record-keeper in Collector's office; Accountants in the Stamp office, Madras, and Forest Conservancy department drawing salaries of Rupees 80 per mensem and upwards. Miscellaneous—Superintendents and Accountants drawing salaries of Rupees 80 and upwards per mensem in the Accountant-General's office; Manager, Office of the Commissioner for the U.C.S. Examinations; Manager, Office of the Director of Public Instruction; Manager, Examiner, Deputy Examiner, Record-keeper, and Accountants drawing Rupees 80 and upwards in the Marine office, Madras; Manager and Record-keeper in the Office of the Chepauk Agent and Paymaster of Carnatic Stipends; all clerks drawing a salary of Rupees 80 and upwards per mensem. (13) Précis-writing—Lower Grade called VIII-B—The offices for which this test is prescribed are the same as those under VII-A—Translation Test, Higher Grade.

Government. In March 1882 the examinations for Pleaderships were withdrawn from the list of Special Tests, the examinations being now conducted by the High Court. In July 1883 a revised set of rules was prescribed for the examination of officers of the Salt department in supersession of the old test (No. IV of the Special Test rules). This examination is now held separately from the other Special Test Examinations. The rules are published in the Fort St. George Gazette of the 31st July 1883. The result of the Special Test Examinations from their commencement in declaring candidates eligible for particular offices is as shown below.^[4] (g) The conduct of the examinations in general education of candidates for schoolmistresses' certificates of the first and third grades and for schoolmasters' certificates of the fifth grade was transferred to the Commissioner for the U.C.S. Examinations in July 1881. Till then such examinations were conducted by the Educational department.

757. OTHER EXAMINING BODIES.—Particulars of other examining bodies can best be seen by the list of miscellaneous tests shown in alphabetical order in the foot-note.^[5]

[5] MISCELLANEOUS EXAMINATION TESTS.—(1) *Agriculture*.—The Principal of the Agricultural College annually examines the students of his college and grants first and second class certificates of proficiency in agriculture. The examination for the two classes of certificates is the same, but to get a first-class certificate a student has to secure a greater percentage of marks for each subject than for a second-class certificate. The subjects in which the candidates are examined are identical with those prescribed for the college itself, viz., Agriculture, Veterinary, Chemistry, Botany, Geology, Land Surveying, Mensuration, Mechanics, Farm Book-keeping. (2) *Civil Engineering*.—Examinations conducted by the Principal of the Civil Engineering College. (a) Examination for Diploma as Assistant Engineer, Public Works department.—This examination is held annually in December, and the test comprises Mathematics, Engineering, Surveying, Levelling, and Drawing and Estimating. (b) Examination for Diploma as Supervisor or Overseer, Public Works department. This examination is held in the month of May, and the subjects are the same as those for the preceding test, but the knowledge required for this examination is of a more elementary nature. The candidates are also tested as to their ability in conversing and writing easy sentences in Tamil or Telooqoo on topics connected with the Public Works department. (c) Examination for Certificate as Draftsman and Estimator. (d) Examination for Certificate as Surveyor. These examinations are held in the month of May, and the tests comprise "Surveying and Levelling," "Drawing and Estimating." No person can be employed as a draftsman in the public service, unless he holds a certificate from the Civil Engineering College. (e) Examination for admission to the Second and Special departments of the Civil Engineering College.—This examination is held in April at the Civil Engineering College and at all the Public Works department head-quarters, at which the candidates present themselves. In the case of Military candidates, the examination is also held at the head-quarters of their regiments. The test comprises the English Language, English Dictation, and Arithmetic. (f) Examination for admission to the Accounts Branch, Public Works department.—This is held biennially in March and September at the Civil Engineering College and at those Public Works department stations at which superior officers consent, at the request of candidates, to supervise the examination. The test comprises Arithmetic, English Dictation and Handwriting. (g) Examination in Tamil or Telooqoo of Military Probationers for the Second department, Civil Engineering College.—This is held annually in July at the head-quarters of the "Q. O." Sappers and Miners, Bangalore. The subjects are translation from English into vernacular and vice versa and writing idiomatic sentences. (h) Examination for Walker Scholarship.—This examination is held once in two years in April at Mangalore, Cannanore, and Calicut, and comprises the subjects of Examination (g) and a colloquial test in Canarese or Malayalam. This examination is confined to natives of Malabar, Canara and the Neilgherries, and the successful candidate receives a scholarship of Rupees 13 per mensem tenable for two years at the Civil Engineering College, and is exempt from the payment of fees. (3) *Education*.—Comparative Examinations of the Lower Fourth and Fifth Classes.—The Director of Public Instruction annually conducts the Comparative Examinations of the Lower Fourth and Fifth Classes of all Government schools and of such aided and "recognised" schools as are desirous of sending in their pupils for the test. The papers are drawn up and the answers valued by examiners appointed by the Director, who are mostly officers of the Educational department. The examina-

758. REWARDS FOR STUDYING LANGUAGES.—A conspectus of these as now given in the Presidency will be found in Vol. II, App. XCVII.

PUBLIC INSTRUCTION.

759. INTRODUCTION.—The general scope of Government educational measures can best be seen from their history, which is sketched in the foot-notes^[1 & 2]. In the annual reports on public instruction the subjects treated of are arranged under

tions are held in the month of December and are intended to test the fitness of pupils for promotion to the next higher class. The subjects for the examination are (a) the English Language, (b) a Vernacular, (c) Arithmetic, (d) History and Geography, and (e) Euclid and Algebra. An examination in a second vernacular for Deputy Inspectors of Schools is also conducted by the Director in the month of August. The Director having deemed it necessary that a Deputy Inspector of Schools should be acquainted with more than one vernacular, has instituted this examination. The standard of the test is that of the University examination which the Deputy has passed, except in the case of Masters of Arts, who will be required to pass in the subjects prescribed for the B.A. Examination. The Deputy Inspectors of Schools are classified into several grades, and the confirmation of a probationary Deputy Inspector as well as the promotion of a permanent Deputy to a higher grade is regulated by their success in this and the special examination next noticed. Special Examination for Deputy Inspectors of Schools.—This examination is held simultaneously with the above, and the subjects are (a) the general and office routine of a Deputy Inspector, (b) the standing orders of the Educational department, (c) the grant-in-aid code, (d) the history; topography, race and caste distribution and population statistics of the division in which the Deputy is serving. (4) *Medicine*.—Candidates for the grade of Apothecary appear before a Board of Medical officers appointed by Government and undergo two tests—one called the Primary Examination and the other the Final or Pass Examination—prescribed by Government in 1883. The examinations are held about the middle of June each year. (5) *Police*.—Departmental portion of the Examination of Officers in Law.—At the request of the Board of Examiners, the Inspector-General of Police draws up a paper in the "Madras Police Orders" and Practice and values the answers thereto. The passing of this examination which is held in January and July entitles an officer to be confirmed in the grade of Assistant Superintendent and Superintendent of Police. The Inspectors' Test.—An examination in the "Madras Police Orders" and Practice also conducted by the Inspector-General of Police is held annually in the month of December. Inspectors and Sub-Inspectors are required to pass this test before confirmation. Station-house Officers' Test.—This examination which is held in the months of January, May and September of each year is conducted by the Deputy Inspectors-General of the Ranges. The text-books are the "Station-house Officers' Manual" and the "Manual of Special and Local Laws." Constables are required to pass this test before they are entitled to promotion. They are also examined in drill and ball practice before they are declared to have passed this test. Constables' Test.—This is a purely vernacular test. No time is fixed for this examination, but the District Superintendents of Police, by whom it is conducted, hold it as often as necessary. The text-book is the "Constables' Catechism," and constables are required to pass this test before they are promoted to higher classes of the grade.

[1] SKETCH HISTORY OF GOVERNMENT EDUCATION THROUGHOUT INDIA.—*Indigenous education*.—The East India Company found four ancient methods of education at work; the instruction given by the Brahmins to their disciples; the *tols*, or seats of Sanscrit learning; the *makhtabs* and *madrassas*, or schools and colleges of the Mahomedans; and a large number of village schools. The latter gave an elementary education to the trading classes and to the children of the petty landholders and well-to-do families among the cultivators; but they did not share in the endowments of the Government. (2) *Early English schemes of education*.—When the East India Company received charge of Bengal from the Delhi Emperor, it aimed only at discharging the duties fulfilled by the previous ruling power. It respected endowments made to educational institutions, and its earliest efforts were confined to the establishment of Mahomedan and Sanscrit colleges of the old type. The Calcutta Madriassa, or Mahomedan college, established in 1781 by Warren Hastings was the first educational institution founded by the British Government in India. It was followed in 1792 by the Sanscrit college of Benares. The discipline of the latter college was to be "conformable in all respects to the Dharma Shastra in the chapter on education." The scholars were to be examined four times a year in the presence of the Resident, "in all such parts of knowledge as are not held too sacred to be discussed in the presence of any but Brahmins." (3) *Native literature encouraged by Parliament*.—In 1813, on the motion of Mr. R. P. Smith, who had been Advocate-General in Calcutta, and obtained a seat in Parliament on his return, a rider was added to the India Bill, directing that a lakh of rupees should be appropriated "to the revival and promotion of literature, and the encouragement of the learned natives of India, and for the introduction and promotion of a knowledge of the sciences among the inhabitants of the British territories out of any surplus which might remain of the rents, revenues, and profits of our territorial acquisition." This vote was interpreted both in London and in Calcutta, to apply chiefly to the revival and encouragement of Hindoo and Mahomedan literature; and there can be little doubt that the grant was intended primarily, though not exclusively, for that object. The fund however was not utilized for ten years. (4) *Progress of education under Lord Hastings*.—Under the Governor-Generalship of Lord Hastings (1813–1823) a powerful impulse was given to the cause of education. Lady Hastings established a school in Barrackpore Park, and compiled treatises for the use of the scholars. Numerous vernacular schools were opened in the neighbourhood of Calcutta by Mr. May, the missionary, and by Dr. Carey and his colleagues, which received encouragement from the Government and the public. (5) *Calcutta Hindoo College*.—Intelligent Hindoos also felt the need of an education better adapted to the wants of the opening nineteenth century. In 1816 the Hindoo college was established in Calcutta, largely through the efforts of David Hare, a watchmaker, but with the full co-operation of the native community. The studies included the works of Locke, Adam Smith, Shakespeare, Milton, and other writers. Lord Hastings accepted the office of patron of this institution. (6) *Poona College*.—The Poona College was founded in 1821. The Peshwa had annually distributed a large sum of money among the Brahmins noted for their learning. Mr. Chaplin, Commissioner of the Deccan, proposed, as a less objectionable method of spending the funds while the original object was in some measure kept in view, that part of the grant should be devoted to the support of a college. (7) *Committee of Public Instruction appointed*.—The fund voted by Parliament in 1813 had accumulated for ten years, when Mr. Adam distinguished his brief tenure of office by appointing a committee of public instruction to suggest measures for the better education of the people in useful knowledge, and the arts and sciences of Europe, and for the improvement of public morals. This enlightened movement was soon after strengthened by the receipt of an unexpected despatch from Leadenhall Street. Mr. James Mill, the historian, now occupied an important position in the India office. A proposal had been received from the Government of India to improve the Hindoo college at Benares, and the Mahomedan college in Calcutta, and to add to them a Hindoo college in the metropolis. It fell to Mr. Mill to draft the reply to this despatch, and he stated that "in professing to establish seminaries for the purpose of teaching mere Hindoo or mere Mahomedan literature, the Government bound itself to teach a great deal of what was frivolous, not a little of what was purely mischievous, and a small remainder indeed in which utility was in any way concerned. The great end of Government

orders from the Government of India in the following order :—(1) Introduction ; (2) General statistics ; (3) Controlling agencies ; (4) University education ; (5) Secondary education ; (6) Primary education ; (7) Schools for special or technical training ;

should be not to teach Hindoo or Mahomedan learning, but useful learning." But Orientalism still maintained its ground in Calcutta. The parliamentary grant was accordingly with some trifling exceptions devoted for ten years longer to the promotion of studies, of which the mode, the medium, and the scope were altogether oriental in their character. (8) *Increased demand for European education.*—Meanwhile, a predilection for English continued to spread among the natives in and around Calcutta, and a demand for instruction in that language, and the acquisition of European science, was pressed with increased earnestness on the attention of the Board of Education. The Board itself was divided into two hostile parties ; the Orientalists, headed by Dr. Wilson, who deprecated any interference with the patronage of Hindoo literature, and the Anglicists, as they were termed, the advocates of a European education through the medium of English, who were animated by the counsels of Mr. C. Trevelyan. The division in the Board brought its operations to a stand-still, and an appeal was made to Government. Mr. Macaulay was then a member of the Supreme Council, as well as President of the Board of Education, and he denounced with force the continued promotion of Orientalism, as tending not to support the progress of truth, but to delay the death of expiring error. "We are at present," he said, "a Board for printing books which are of less value than the paper on which they are printed was when it was blank, and for giving artificial encouragement to absurd history, absurd metaphysics, absurd physics, and absurd theology." The question was brought to a temporary settlement on the 7th March 1835, by a resolution of the Governor-General in Council, Lord William Bentinck, which stated that "the great object of the British Government ought to be the promotion of European literature and science among the natives of India, and that the funds appropriated to education would be best employed on English education alone." To qualify this decision however it was stated that no college or school of oriental learning was to be abolished, while the natives were inclined to avail themselves of it ; and the stipends to the teachers and students were to be continued, though not renewed in case of lapse. It was directed that the publication of oriental works and of translations of medical and mathematical works into Arabic, which neither the teachers nor pupils could comprehend, should be at once discontinued. Lord William Bentinck's resolution encountered much opposition, and the Asiatic Societies in Calcutta and in London, as well as those on the Continent, came forward to deprecate it as a severe discouragement of the cultivation of oriental literature. Reply was made that whereas it was the duty of a liberal Government to patronize such labours as those of the oriental societies, and to make arrangements for the preservation of the ancient monuments of Indian civilization, whether in stone or manuscript ; still it was a dereliction of duty to divert to the promotion of this object the scanty funds allotted to the education and improvement of the people. It was observed that it was impossible to discover how the gradual withdrawal of Government aid from the two or three colleges it had established could affect in any perceptible degree the cultivation of the sacred language of the Vedas. The encouragement of English was, on the other hand, one of the highest blessings which could be conferred on the country. Officially this controversy came to an end in 1839, and the question of the support of the study of oriental classics from state funds has since died a natural death. Nor has this controversy ever affected to any extent the Madras Presidency, where the only question connected with language has been that of the relative claims of English and the ordinary vernaculars as subjects of study or as the languages of instruction in secondary and elementary schools and of the substitution of Sanscrit for the vernaculars in the higher examinations in arts ; and this question has been allowed to resolve itself practically, following the ordinary rules of demand and supply. (9) *Sir Henry Hardinge's resolution.*—Within three months after his arrival as Governor-General in 1844, Sir Henry Hardinge passed the memorable resolution, which held out the encouragement of office and promotion in the public service to the successful students of the Government colleges, as well as of private institutions ; and thus gave the state the benefit of the talent which it had assisted to develop. This liberal measure was not fully carried out till after the establishment of the University of Calcutta, to which the various educational institutions in the Bengal Presidency were affiliated. (10) *Progress under Lord Dalhousie.*—The cause of education received special encouragement from Lord Dalhousie (1848—56). Mr. Thomason, the Governor of the North-West Provinces, had established a Government vernacular school in each revenue division of certain districts under his charge. The experiment was attended with such signal success that Lord Dalhousie resolved to extend the system to the whole of the North-West Provinces as well as to Bengal and the Punjab. At the suggestion of Mr. Bethune, the Legislative Member of Council, who devoted his time and his purse to the cause of female education, Lord Dalhousie officially announced that the education of females was considered by the British Government an object of national importance, and he was the first Governor-General who proclaimed this doctrine in opposition to native views. On the death of Mr. Bethune, he took on himself the support of the female school established by that gentleman. It was while engaged in devising plans for the improvement of education that he received the despatch of July 1854, which has been denominated "The Intellectual Charter of India." (11) *Principles of State education settled.*—In the despatch just mentioned the education of the whole people of India was definitely accepted as a State duty ; and the Court of Directors laid down with fulness and precision the principles which were to guide the Indian Government in the performance of this great task. After the East India Company itself had ceased to exist, the principles of this despatch were confirmed by the Secretary of State in his despatch of the 7th April 1859. The purport of the two documents may be thus summarised. (12) *The Despatch of 1854.*—The Despatch of 1854 commends to the special attention of the Government of India the improvement and far wider extension of education, both English and Vernacular, and prescribes as the means for the attainment of these objects :—"a." the constitution of a separate department of the administration for education ; "b." the institution of Universities at the Presidency towns ; "c." the establishment of institutions for training teachers for all classes of schools ; "d." the maintenance of the existing Government colleges and high schools and the increase of their number when necessary ; "e." the establishment of new middle schools ; "f." increased attention to vernacular schools, indigenous or other, for elementary education ; and "g." the introduction of a system of grants-in-aid. The attention of Government is specially directed to the importance of placing the means of acquiring useful and practical knowledge within reach of the great mass of the people. The English language is to be the medium of instruction in the higher branches, and the vernacular in the lower. English is to be taught wherever there is a demand for it, but it is not to be substituted for the vernacular languages of the country. The system of grants-in-aid is to be based on the principle of perfect religious neutrality. Aid is to be given (so far as the requirements of each particular district as compared with other districts and the funds at the disposal of Government may render it possible) to all schools imparting a good secular education, provided they are under adequate local management and are subject to Government inspection, and provided that fees, however small, are charged in them. Grants are to be for specific objects, and their amount and continuance are to depend on the periodical reports of Government Inspectors. No Government colleges or schools are to be founded where a sufficient number of institutions exist capable, with the aid of Government, of meeting the local demand for education ; but new schools and colleges are to be established and temporarily maintained where there is little or no prospect of adequate local effort being made to meet local requirements. The discontinuance of any general system of education entirely provided by Government is anticipated with the gradual advance of the system of grants-in-aid ; but the progress of education is not to be checked in the slightest degree by the abandonment of a single school to probable decay. A comprehensive system of scholarships is to be instituted so as to connect lower schools with higher, and higher schools with colleges. Female education is to receive the frank and cordial support of Government. The principal officials in every district are required to aid in the extension of education ; and in making appointments to posts in the service of Government, a person who has received a good education is to be preferred to one who has not. Even in lower situations a man who can read and write is, if equally eligible in other respects, to be preferred to one who cannot. (13) *Secretary of State's despatch.*—The Despatch of 1859 reviews the progress made under the earlier despatch, which it reiterates and confirms with a single exception as to the course to be adopted for promoting elementary education. While it records with satisfaction that the system

(8) Scholarships ; (9) Employment of students in the public service ; (10) Books. In the present article the order of remarks will be as follows :—a brief enumeration of educational institutions connected with the department classed according to

of grants-in-aid has been freely accepted by private schools, both English and Anglo-Vernacular, it notes that the native community have failed to co-operate with Government in promoting elementary vernacular education. The efforts of educational officers to obtain the necessary local support for the establishment of vernacular schools under the grant-in-aid system are, it points out, likely to create a prejudice against education, to render the Government unpopular, and even to compromise its dignity. The soliciting of contributions from the people is declared inexpedient, and strong doubts are expressed as to the suitability of the grant-in-aid system as hitherto in force for the supply of vernacular education to the masses of the population. Such vernacular instruction should, it is suggested, be provided by the direct instrumentality of the officers of Government, on the basis of some one of the plans already in operation for the improvement of indigenous schools, or by any modification of those plans which may suit the circumstances of different provinces. The expediency of imposing a special rate on the land for the provision of elementary education is also commended to the careful consideration of the Government. (14) *Main feature of the two despatches.*—The main feature of the two despatches, which most distinguishes them from all previous orders on the same subject, is contained in the following extract from the Despatch of 1854 :—"It is well that every opportunity should have been given to those (the higher) classes for the acquisition of a liberal European education, the efforts of which may be expected slowly to pervade the rest of their fellow-countrymen, and to raise, in the end, the educational tone of the whole country. We are, therefore, far from underrating the importance, or the success, of the efforts which have been made in this direction ; but the higher classes are both able and willing, in many cases, to bear a considerable part at least of the cost of their education ; and it is abundantly evident that in some parts of India no artificial stimulus is any longer required in order to create a demand for such an education as is conveyed in the Government Anglo-Vernacular colleges. We have, by the establishment and support of these colleges, pointed out the manner in which a liberal education is to be obtained, and assisted them to a very considerable extent from the public funds. In addition to this, we are now prepared to give, by sanctioning the establishment of Universities, full development to the highest course of education to which the natives of India, or of any other country, can aspire ; and besides, by the division of University degrees and distinctions into different branches, the exertions of highly educated men will be directed to the studies which are necessary to success in the various active professions of life. We shall, therefore, have done as much as a Government can do to place the benefits of education plainly and practically before the higher classes in India. Our attention should now be directed to a consideration if possible, still more important, and one which has been hitherto, we are bound to admit, too much neglected, namely, how useful and practical knowledge, suited to every station in life, may be best conveyed to the great mass of the people, who are utterly incapable of obtaining any education worthy of the name by their own unaided efforts ; and we desire to see the active measures of Government more especially directed, for the future, to this object, for the attainment of which we are ready to sanction a considerable increase of expenditure." On the same subject the Despatch of 1859 declared that "if Government shall have undertaken the responsibility of placing within the reach of the general population the means of simple elementary education, those individuals who require more than this may, as a general rule, be left to exert themselves to procure it with or without the assistance of Government." Education for the great mass of the people is not the sole object of either despatch. On the contrary, it is clear from the summary given in paras. 12 and 13 above that schools were to be maintained for "every condition of life," including schools of higher education intended for what may be called the higher classes. Nevertheless if any portion of the orders can be pronounced characteristic and distinctive, it is that portion which not only had never been enunciated before, but was opposed both to the earlier policy and to the reiterated views of the most influential educational agencies then in existence in India. The policy of 1854 has been expressly re-affirmed in the orders constituting the recent Educational Commission. (15) *Education Department formed.*—On the publication of the despatch of 1854, steps were taken to form an Education Department in each of the territorial divisions of India as then constituted. At this point however the narrative can properly be taken up from that next given for this Presidency.

[2] *SKETCH HISTORY OF EDUCATION IN THE MADRAS PRESIDENCY.*—*Indigenous education found by the English.*—Indigenous education was universal in this Presidency, as in other parts of India, long before the commencement of British rule. In every Hindoo matt or monastery and in every large town or village with Brahmin residents, instruction in some branches of Sanscrit learning, or in the Tamil classics and poornas, has been from time immemorial a recognized feature ; while almost every village, large or small, has from a very early date had its village school. The description of such education at the present day is equivalent to describing what it was a century or two back, for no change is perceptible. Some brief remarks on this subject will be found in the text. (2) *The first measures by the English at Fort St. George.*—The earliest record on the subject of education in Madras by the English settlers is a list of employes furnished to the Directors by the President and Council of Madras, as they stood on the 31st December 1678. In this list appears the name of "Ralph Ord, Schoolmaster," and he drew the then high salary of £60 per annum, equal to that of the junior member of council. He had landed in Madras in July 1678, only 38 years after the founding of the settlement. (3) *Proposals for education by the Madras corporation.*—The next reference to the subject is in a general letter of the Court of Directors to the Governor of Madras, dated 28th September 1687. This letter contains the draft of a proposed municipality for Madras, based on the model of those introduced by the Dutch into their eastern settlements, although the verbal form of the charter thus sketched is drawn from one of those constituting an English corporation. The suggestions concerning education are as follows :—"The Court of Aldermen may, by virtue of the powers granted by our intended charter, assess and levy a rate upon the inhabitants for the building of one or more free school or schools for teaching the English tongue to Gentoos or Moors or other Indian children, and for salaries to the schoolmasters, and by degrees for many other good works ; their constitution being so framed that our President and Council shall always influence their debates and resolutions." In March 1691 Governor Yale reminded the corporation that they had as yet done nothing in the way of providing schools, and demanded that the funds received for this and other unfulfilled purposes should be restored to Government, seeing that if the public "are not benefited, there is no reason why they should be losers by the corporation." In January 1702 the Court of Directors also called attention to the manner in which education had been neglected. It does not appear that anything special was done. (4) *Saint Mary's Charity School at Madras.*—When the old and new Companies amalgamated, to form the "United Company of Merchants trading to the East Indies," a clause was inserted in the new charter, binding the Company to provide schoolmasters in all their garrisons and superior factories, and in February 1712 the Directors wrote that they were determined to act up to this provision. A year previously, in 1711, the Society for Promoting Christian Knowledge had offered to the Directors to provide and maintain at Madras one or more charity schools through the agency of the Danish missionaries at Tranquebar, of whom the chief was the famous Ziegenhals. In 1713 the Madras Government replied that they would do all in their power to aid these schools. Before this proposal could be carried out, the English inhabitants of Madras had convened a public meeting on the 28th October 1715, when it was resolved to establish a charity school for Protestant (European or Eurasian) children, giving them diet and education gratis. "While they are entertained in the school the boys shall be taught to read, write, cast accounts, and what they may be further capable of, and the girls shall be instructed in reading and the necessary parts of housewifery." It is believed that this was the foundation of the school known as the Fort School, of which the female branch has long been closed. Saint Mary's Charity School, as it was officially styled, has now ceased to have a separate existence, being amalgamated with the Civil Asylum. (5) *Schools for natives opened by Danish missionaries from Tranquebar.*—The Danish missionaries above mentioned arrived in Madras in the early part of the year 1717, when, according to the Proceedings book of the Madras Government, Monday, 27th May, "the President lays before the

the mode in which they are supported ; a more particular account of the same institutions classed according to the education given in them, with their curricula, and the testing examinations belonging to each ; a description of indigenous

Board a paper of proposals delivered him by Mr. Grundler, one of the Danish missionaries lately arrived from Tranquebar, for erecting two charity schools in this city. It is agreed that liberty be given for erecting two charity schools—one for Portuguese in the English town, and another for Malabars in the Black Town." Thus first public effort to educate the "Malabars" or Tamul people was at the hands of missionaries. The pyall schools had received no state or municipal recognition. When these schools were established, the factors and other residents of Madras disapproved of the teachers being foreigners, and repeated protests were made to the home authorities. The Society for Promoting Christian Knowledge replied that no Englishman could be persuaded to go out. In 1746 English was employed as the language of the mission, being introduced by the missionary Geister. This was not effected without opposition on the part of the other German and Danish missionaries. However not long after this the German language was forgotten, and the missionaries themselves became Anglicized, founding the known families of the Kohlhofts, Breithaupts, Pazolds, Pohles, and others. (6) *Progress of schools for natives.*—Emulating the activity of Ziegenbalg and his colleagues the Company established in 1717 a school for native children at Cuddalore, and this was the beginning of the great system of Anglo-Vernacular education maintained under the patronage of Government in this Presidency. Mr. Ord had confined his labours to English children. The second schoolmaster whose name survives was named Radewitz, who was for many years the teacher of the Portuguese school established by Ziegenbalg in the Fort. He died in 1732. The Malabar or native school opened by Ziegenbalg, or under his direction, soon ceased to exist, for there was no public appreciation of the value of education, while the natives held aloof from the school because of its Christian character. When the Missionary Schultze settled in Madras in 1726, he re-opened this school, and, under his energetic direction, it soon filled with scholars, and was the origin of the present Vepery Anglo-Vernacular school, which has enjoyed an almost continuous existence ever since the original school was first located in Black Town. The different schools thus founded were maintained for many years entirely from funds provided by the "Society for Promoting Christian Knowledge." (7) *Educational work in Madras of the Society for Promoting Christian Knowledge; assistance rendered to the Tranquebar mission.*—Established in 1639 during the reign of William III for the purpose of spreading Christian knowledge, this society very soon found itself engaged in semi-missionary operations. To allow purely mission work to be carried on without interfering with the true work of the Society for Promoting Christian Knowledge its founders established in 1701 a new society, that for the "Propagation of the Gospel in Foreign Parts," and from that day to this the two societies have worked hand-in-hand, the Society for the Propagation of the Gospel providing missionaries, the Society for Promoting Christian Knowledge helping them with schools and furnishing books. One of the first objects of the society's concern has always been to promote the education of the young by liberally communicating its resources for the benefit of charity schools. In or about 1711 the Society for Promoting Christian Knowledge heard of the labours and requirements of the Tranquebar mission and sent them money, a printing press, paper, and other stores. In 1714 Ziegenbalg went to Europe for the purpose of promoting the cause he had engaged in. He was presented to the King of Denmark at Stralsund; and on visiting England was admitted to the presence of George I, by whom he was warmly encouraged. The bishops and the public received him with much cordiality; and the Society for Promoting Christian Knowledge in particular treated him with distinction, and aided him with presents of money, books, paper, and similar stores. After an absence of nearly two years, Ziegenbalg relanded at Madras in August 1716. Here, with the assistance of the Rev. William Stevenson, the garrison chaplain, schools were soon established at Madras and at Cuddalore. The latter of these places Ziegenbalg occasionally visited; it was here, too, that eventually he died in February 1719 at the early age of 36. Mr. Stevenson went home. His schools fell off, and were finally closed. Under these circumstances, in 1726, Schultze resolved to remove to Madras. The Christian Knowledge Society approved of the undertaking and gave the necessary aid to promote it; the garrison chaplain entered into his views; the Governor and Council were enlisted in his favor; and under these favorable auspices Schultze was established in Black Town in a house purchased in 1728 expressly for the use of the new mission. In 1734 Mr. Schultze informed the society that in a recent visit of Mr. Sartorius to Fort St. David the Governor of that station had expressed his willingness to co-operate in the establishment of a mission in the neighbourhood. The society immediately authorized Mr. Schultze to take the necessary steps for the execution of this plan; and to prove their readiness to promote the full efficiency of their new missions, sent at the same time a munificent contribution towards the erection of a church and two schools at Madras. The amount of money sent out by this society in the years 1736 and 1737 was £3,200, which liberality enabled the missionaries to establish themselves effectually at Cuddalore, to which place Sartorius and Geister now removed. (8) *The same; occurrences during the French occupation of Madras.*—In 1746 the French under La Bourdonnais bombarded Madras; and having compelled Fort St. George to capitulate, they levelled a great part of Black Town for the purpose of improving the defences. Up to that time Black Town extended right across the esplanade to the Fort wall. In fact the burial ground, now remembered only by the monument to the daughter of Governor Yale still standing on the monument esplanade, was then in the heart of Black Town, and the best houses were those nearest the fort. Among them was the German Mission-house, which was thus destroyed. The church was converted into a magazine. Fabricius removed to Poolicat, then a Dutch settlement, where he and his converts were well received. While Dupleix was in possession of Madras and he believed the English could never return, he gave permission to a wealthy Armenian Roman Catholic merchant to build a church and mission buildings at Vepery on land which he assigned for the purpose. It was on the site of the present Vepery church, and, in fact, was the building which served as the Vepery church until the present building was erected. When the English regained Madras, the Armenian merchant and the Catholics generally were held to be intriguing with the French at Pondicherry. The Vepery premises were therefore confiscated by Government. In 1752 the local Government presented them to the Protestant mission. In November 1760 Count Lally besieged Madras; and Mr. Fabricius at Vepery was a second time exposed to the dangers and difficulties incident to such a state of things. Before he could obtain protection from the French officers, the native cavalry which accompanied the force had plundered him and his colleague Breithaupt of nearly all they possessed. The risk incurred by remaining amidst such scenes of violence induced the missionaries to remove, as on the former occasion, to Poolicat, where, though accompanied by a crowd of destitute and helpless followers, they were again most hospitably received by the Dutch. In February 1761, Madras having been relieved and the siege raised, the missionaries returned to Vepery. (9) *The same; the first printing-press at Madras.*—The year 1761 was also made remarkable by the establishment of the first printing-press in Madras. It was found at Pondicherry when that place was captured. The Government presented it to the mission, who thereupon set up the printing press at Vepery, which still remains one of the most perfect in this Presidency. (10) *The same; the first establishment for Eurasian children.*—In the year 1784 the Christian Knowledge Society having heard of the valuable institution in Bengal for the education in Christian principles of the children of English fathers by native mothers, voted a sum of £50 annually for the maintenance of a schoolmaster at Madras, who should be required to give instruction to that class of children. (11) *The same; the Military Orphan Asylum, and Dr. Bell's Madras system.*—In 1786 Government made another step by aiding the foundation of the Military Female Orphan Asylum. The buildings were presented to the Asylum committee by the Nawab of the Carnatic who purchased them for the purpose at a cost of Rupees 80,000. The Missionary Gerické was the first superintendent. The institution was highly successful, and led two years afterwards to the foundation of the Military Male Orphan Asylum. The opening of the latter marked an era in the history of elementary education not only in Madras, but throughout the world. Its first superintendent was the famous Dr. Bell, whose interest in education was so great that he served without a salary, so that funds might be provided for the improvement of the school. Want of means to provide for the great number of applicants for admission, combined with the fact that there were no competent teachers that could be engaged to assist him, led Dr. Bell to invent what has since been known as the monitorial system of education. Known at first as Dr. Bell's or the

institutions not brought under the operations of the department ; a description of various special institutions ; an account of the constitution of the controlling and teaching agencies ; remarks on financial, statistical, and general questions.

Madras system, it at once revealed how education could be both efficient and inexpensive, and thus became the basis of all modern progress in elementary education. What are known as the Lancasterian, Pestalozzian, Glasgow, monitorial, and pupil-teacher systems have all grown out of this, and every public elementary school in England is now conducted on one or other modification of the Madras system. (12) *The same ; provincial schools for natives.*—About the same time Mr. Sullivan, then Resident at Tanjore, invited Swartz to accompany him in the capacity of an interpreter on a visit to the Maravar country. At Ramnand, Mr. Sullivan acquainted Swartz with a plan he had devised for instructing the natives, and establishing schools in every province. This plan was that a seminary should be established at Tanjore, under the missionary's personal supervision, for the education of schoolmasters, who should afterwards be located in the several villages of the country at the expense of the petty princes. The Rajah of Ramnand was spoken with on the subject, and thought "it would be an excellent plan," wishing "there were such schools in every village." His minister also approved it, and the Rajah gave a written promise to settle a monthly sum, afterwards fixed at 24 pagodas to be paid to the school. At Shivagunga also the local ruler approved the plan, and promised to give a village for the support of a schoolmaster. He subsequently gave two villages. The Governor of Madras and the Nawab of Arcot were next written to, and both highly commended the plan. The Rajah of Tanjore promised 40 pagodas per month for the support of the school to be established in or near the fort. These provincial schools answered exceedingly well. In those at Tanjore and Combaconum there were already 40 scholars ; while in the Tamil school at Tanjore there were 99 boys, of whom 35 were charity boys maintained and clothed by the mission. Two English schoolmasters were employed for the provincial schools, and four masters were engaged for the Tamil school. (13) *The same ; origin of the Civil Orphan Asylums.*—By the will of Mr. Gerické, who died in 1803, it appears that an English orphan asylum for children not eligible for the Military asylums had existed in connexion with the Vepery Mission for many years previously. This orphanage was probably the origin of the present Civil Orphan Asylum. The school continued to flourish, and in 1793 the Rajah of Tanjore sent his son and successor Sarbhoojee to be educated there under the Missionary Gerické. Sarbhoojee remained in the school from 1793 to 1797. (14) *The same ; transfer of mission work to another society, and miscellaneous operations.*—Meanwhile the printing press had not flourished, and in 1810 the press had to be closed because there were no means of paying the workmen, although there were ample stores of paper, type, &c. This was the more to be regretted, because from the first the profits had been destined for the support of schools. Later the press was re-organized. This was owing to the establishment in 1815 of the District Committee of the Society for Promoting Christian Knowledge which relieved the missionaries of the care of secular matters and infused new vigour into the whole work. Madras education is much indebted to the zealous work of this little known but very useful body. At Tinnevely Mr. Hough reported that he had, under the auspices of the society, established nine schools, in which were educated 283 children, the total annual expense of which amounted only to 857 rupees. In 1815 a change of organization was made. It had for some time been felt that the Christian Knowledge Society, from the nature of its constitution and its peculiar objects and principles, labored under several disadvantages in its attempts to conduct so extensive a missionary establishment ; and in the year 1825 the society's missions were by mutual agreement transferred to the Society for the Propagation of the Gospel in Foreign Parts, a district committee of which was established in Madras in the year 1826. The terms on which this transfer was made appear to have been understood as follows :—that the Christian Knowledge Society should continue to maintain those missionaries, who, from their having been for some years in their service, could not with propriety be unceremoniously transferred to another society ; that it should retain its right to the property purchased and acquired in the several missions during its administrations of their affairs ; and that by means of its press at Vepery and its grants of books, stationery, &c., it should maintain or supply schools for the education of the natives ; and thus by furnishing them with European knowledge it should facilitate the operations of the sister society, which henceforth undertook the whole management and direction of the missions. From this time, therefore, the history of the missions belongs to the Society for the Propagation of the Gospel. The press was still managed by the Society for Promoting Christian Knowledge and became each year more successful. The paper, presses, English type, ink, binding materials, &c., were supplied from England at great expense while the types for the several eastern languages were cut and founded in the establishment itself. The benefits derivable to the natives from this institution were great and various. Elementary school works in a variety of languages were supplied most liberally to the several missions : the money proceeds of the establishment, after the payment of the workmen, went to form a fund called the Native Education Fund, dedicated, as its name imports, solely to the maintenance of native schools in various parts of the Madras Presidency. (15) *The same ; commencement of female education.*—Under the direction of the committee, the Vepery Grammar school was repeatedly enlarged, and became, till the establishment of the Free Church Mission, the chief educational agency in Madras. There were also two "charity schools," male and female, for the Christian children of Vepery, and, lastly, male and female schools, where all native children that came were taught without charge. The Society for Promoting Christian Knowledge were thus the pioneers of female education. The proportion of female scholars at Vepery at this time is especially striking ; being 654 to 4,290 boys, or 1 girl for every 6½ boys. (16) *The same ; Bishop Corrie's school.*—Bishop Corrie's school was opened as the "Madras Grammar school" on the 1st July 1836 under the advice of Bishop Corrie and with the aid of the Christian Knowledge Society. (17) *Work of the London Missionary Society.*—In 1805 the London Missionary Society commenced its work in Madras. The labours of the missionaries at Serampore had drawn the attention of the society to India, and, as soon as there was any liberty of entrance, a missionary was sent to Madras, and he at once opened a school. From that day to this the London Mission has honorably distinguished itself in education. In recent years it has not aimed at academical distinction, but its schools are efficient and popular, the central institution in Armenian street is well attended. (18) *Work of the Wesleyan Mission.*—This was founded in Madras in the year 1819 when Messrs. Squance, Lynch, and Close came from Ceylon to establish a mission there. In Ceylon schools had formed a most important part of the mission work, and have continued to flourish there from that day to this. Thus in the year 1819 when the Madras mission opened, the society maintained no less than 87 schools in Ceylon, attended by 5,014 children, of whom many were girls. Probably no other mission to the east ever maintained so perfect a school system as that which existed in Ceylon. The great institution at Jaffna was in after-years a sort of University, from which issued large numbers of Native Christians, who have since risen to prominence in both Ceylon and Southern India. It was to be expected, therefore, that schools should form an important part of the early work of the Wesleyan Mission in Madras. Before the society had been a year in Madras it had established two schools, one at Royapettah and the other in Black Town. The former was the origin of the present Royapettah Anglo-Vernacular school, which has enjoyed a continuous existence though not always in the same premises from that to this, and is therefore only second to the Vepery Anglo-Vernacular school in point of age. In 1823 two new schools were opened at Negapatnam. (19) *Operations by the Government ; the Tanjore schools.*—No other missionary body established schools for a long period after the London and Wesleyan Missionary Societies were in the field. Attention may be turned here to the operations of this state in connection with education. The Protestant mission, conducted successively by Messrs. Ziegenbalg, Gerické, Kiernander, and Swartz, under the patronage as has been seen of the Society for Promoting Christian Knowledge, had had schools at their several stations of Madras, Cuddalore, Tanjore, and Trichinopoly, in which they instructed the natives, and in aid of which they obtained occasional grants from the local Governments, and permission from the Court of Directors to receive from the society in England various supplies free of freight. In 1787 the Court of Directors authorized a permanent annual grant towards the support of three schools which had been established with the sanction of the respective Rajahs at Tanjore, Ramnand, and Shivagunga, of 250 pagodas each. These schools were under the direction of Mr. Swartz. The Court further directed that a similar allowance

760. DESCRIPTION OF EDUCATIONAL INSTITUTIONS ACCORDING TO UPKEEP.—Omitting for the moment the Madras University, and such institutions as deal with special or professional instruction, the remainder of the institutions of the Presidency in

should be granted to any other schools which might be opened for the same purpose. According to the books of establishment, the charge on this account was for two Protestant schools at Tanjore and Combaconam Rupees 4,200 per annum, together with a pension or allowance to Mr. Kolhoop, a retired teacher, of Rupees 420, making a total of Rupees 4,620 per annum. In 1824 the widow Swartz enjoyed a pension from the British Government of two pagodas per month at Negapatam, and an unmarried female of the same name a monthly allowance of one fanam. (20) *The same; Sunday School at the Mount.*—In January 1812 a Sunday school was established at St. Thomas' Mount, at the suggestion and under the direction of the Military Chaplain at that cantonment, and by the voluntary contributions of several Europeans at the Presidency. The object of this school was to afford elementary instruction on the Lancasterian plan to the half-caste and native children of the military and others resident there. The object as well as the plan of tuition being highly approved by the Government, an endowment of 800 pagodas per annum was granted from the 1st January 1812. (21) *The same; the Cuddapah scheme.*—In 1814 Mr. Ross, the Collector of Cuddapah, suggested that great advantages would result from giving education to the natives of India, and offered to the consideration of Government a plan for providing proper education and moral instruction for young men, particularly Brahmins, from the age of 12 or 13 to that of 18 or 20, and by establishing an institution for education in every district. The subject was referred to the College Board for their consideration and report. The Government, however, entertaining great doubt whether the proposed measure would be found of sufficient efficacy to answer the end proposed, and observing that it admitted of a limited experiment, authorized such an experiment to be made in Cuddapah under the superintendence of Mr. Ross, whose superintendence they observed afforded the best prospect of success. Mr. Ross was at the same time cautioned against incurring any considerable expense, or giving any pledge in the confidence of success, which, in the event of failure, might be found to be inconvenient. He did not long afterwards, and no report of his further proceedings with respect to this object can be traced in the records. (22) *The same; enquiries instituted by Sir Thomas Munro.*—On the 2nd July 1822, Sir Thomas Munro, the Governor of the Presidency, recorded a minute, recommending as an object of interest and importance that the best information should be obtained of the actual state of education in its various branches among the native inhabitants of the provinces under the Madras Government. A circular letter was accordingly addressed to the several Collectors. In June 1826 the Government forwarded to the Court of Directors the several returns which they had received from the Collectors, accompanied by an abstract of those returns, of which the following is a summary:—(23) *The same; abstract of the replies received.*—The schools then existing in the country were for the most part supported by the payments of the people who sent their children to them for instruction, the rate of payment for each scholar varying in different districts, and according to the different circumstances of the parents of the pupils, from one anna to four rupees per mensem; the ordinary rate among the poorer classes appearing to be generally about four annas, and seldom to exceed half a rupee. There were endowments for the support of schools only in the seven districts next noted. "Rajahmundry."—There were in this district 69 teachers of the sciences who possessed endowments in land, and 13 who enjoyed allowances in money granted by former zemindars. "Nellore."—In this district certain individuals, Brahmins and Mussalmans, were in possession of allowances in land and money granted by the Carnatic Government for teaching Vedas, &c., and Arabic and Persian respectively, to the amount of Rupees 1,467 per annum. "Arcot, Northern Division."—There were in this district 28 colleges, supported by manyams and morahs, granted by former Governments, yielding Rupees 516 per annum, and six Persian schools maintained at the public expense, at an annual charge of Rupees 1,361. "Salem."—There were inam lands in this district estimated to yield Rupees 1,109 per annum, which were appropriated to the support of 20 teachers of theology, &c., and one Mussalman school, which had land for its support, yielding annually Rupees 20. "Tanjore."—There were in this district 41 schools and 77 colleges, which were supported by the Rajah. There was no school or college endowed particularly by the Circar; but the free schools maintained by the mission established in Tanjore were stated to possess a sarvamaniam, the annual value of which was estimated at Rupees 1,100. "Trichinopoly."—There were in this district seven schools, which possessed endowments in land to the extent of 46 cawnies, granted by former Governments. "Malabar."—There was in this district one college supported by the Zamorin which had also some land attached to it. The Collectors of the four districts next mentioned made returns to the following effect. "Salem and Coimbatore."—It was admitted by the Collectors of these districts that public endowments for the advancement of learning had been diverted from their original purposes or resumed. In the former district the value of land so diverted was estimated at Rupees 384; in the latter at Rupees 2,208. "Bellary."—The Collector of this district stated that, although none of the institutions for education at present existing in it derived support from the State, there was no doubt that in former times, especially under the Hindoo Governments, very large grants, both in money and in land, were issued for the support of learning, and he further stated his opinion that many of the yeomias and shrotriams, which were then held by Brahmins in the district, might be traced to this source. Of the correctness of this suggestion, the Revenue Board entertained considerable doubts. "Canara."—The Collector of this district stated generally that there were no colleges in Canara for the cultivation of abstract science; neither were there any fixed schools and masters to teach them. There was no instance known of any institution of the above description having ever received support in any shape from the former Government. In Canara education was conducted so much in private, that any statement of the number of private schools, and of the scholars attending them, would be of little or no use, but on the contrary, rather fallacious, in forming an estimate of the proportion of the population receiving instruction. (24) *The same; Sir Thomas Munro's remarks thereon.*—These reports (with the exception of that of the Collector of Bellary) furnished no answer to the inquiry respecting the books generally read at the schools, except that the Shastras and Vedas were read, and that the sciences of theology, astronomy, logic, and law were taught but chiefly privately. "From these reports," Sir Thomas Munro remarked, "it appears that the number of schools, and of what are called colleges in the territories under the Presidency, amount to 12,498, and the population to 12,850,941, so that there is one school to every 1,000 of the population; but, as only a few females are taught in schools, we may reckon one school to every 500 of the population." The male population he estimated at 6,425,000. The proportion of this number, "between the ages of 5 and 10 years, which is the period which boys in general remain at school," he took at one-ninth, or 713,000. This he took to be the number of boys that would be at school, if all the males above 10 years of age were educated; but the number actually attending the schools appearing to be not more than 164,110, it followed that not quite 1 in 4 of the male population enjoyed the benefit of a school education, and that the female population was almost wholly destitute of it. But taking into this account the probable numbers taught at home, (which the Collectors' returns did not state, excepting that in Madras the private scholars amounted to 26,963, or above five times more than those taught in the schools), Sir Thomas Munro considered it probable that the number of the male population who then received education was nearer to one-third than one-fourth. The practice of private tuition, he observed, varied considerably. It was not unfrequent in any part of the country, but the proportion was very different in different classes. In some it was nearly the whole; in others it was hardly one-tenth. He further observed that, low as the state of education in India was admitted to be, compared with that of England, it was even then, he thought, higher than it was in most European countries at no very distant period. "It has no doubt," he added, "been better in earlier times, but for the last century it does not appear to have undergone any other change than what arose from the number of schools diminishing in one place and increasing in another, in consequence of the shifting of the population, from war and other causes." The ignorance of professed teachers and poverty of parents were considered as the causes which now combine to keep education in a low state. Owing to the comparatively great number of professed teachers, the number of scholars attached to each was small, and the monthly rate paid by each scholar did not exceed from four to six or eight annas. So that teachers did not earn more than six or seven rupees monthly, which was not considered an allowance sufficient to induce men properly qualified to follow the profession. To remedy these defects

connection with the Educational department may be divided, according to the mode in which they are supported, into four classes as follows. (i) Public institutions under the direct management and control of the Educational department and

Sir Thomas Munro suggested by the Madras School Book Society, towards which he recommended that the Government should allow 700 rupees per month; also, that two principal schools should be established in each Collectorate—one for Hindoos and the other for Mahomedans, and that hereafter, as teachers could be found, the Hindoo schools should be augmented, so as to give one to each tahsildary, which would be about 15 to each Collectorate. The Mahomedan population not amounting to above one-twentieth of the Hindoo, it was considered sufficient to establish one Mahomedan school in each Collectorate, except Arcot and a few other Collectorates, where the proportion of the Mahomedan population was greater. "Whatever expense," Sir Thomas Munro added, "Government may incur in the education of the people, will be amply repaid by the improvement of the country; for the general diffusion of knowledge is inseparably followed by more orderly habits, by increasing industry, by a taste for the comforts of life, by exertion to acquire them, and by the growing prosperity of the people." The Sir Thomas Munro concluded by recommending the appointment of a Committee of Public Instruction, and by an expression of the most entire confidence in the final success of the measure, although he concurred in the opinion that that success must be progressive and would be slow. (25) *The same; appointment in 1823 of a Committee of Public Instruction in accordance with Sir Thomas Munro's views.*—With a very slight modification, the Council concurred in the President's suggestions, which were accordingly recommended for adoption by the Court of Directors, and the following gentlemen were appointed a Committee of Public Instruction at Madras:—H. S. Groom, Esquire, W. Oliver, John Stokes, and A. D. Campbell, Esquires. A disbursement of Rupees 46,000 per annum was authorized, inclusive of Rupees 6,000 per annum, and exclusive of a donation of Rupees 3,000 in aid of the funds of the Madras School Book Society, whose benevolent labors were warmly eulogised, and a confident persuasion expressed that they would, by furnishing good school books, materially contribute to the attainment of the end for which the committee had been instituted. (26) *The same; the Normal school and Tahsildary schools.*—The first effort of the new Committee of Public Instruction was the establishment of a normal school for the training of teachers, for which accommodation was provided in the building used by the College Board for the examinations of the junior civil servants and for other purposes. An English head master was retained on a salary of Rupees 300 a month, and an arrangement was made by which the heads of the head masters in the civil and vernacular departments under the College Board were rendered available to the committee at a trifling cost. Having made the next step taken by the committee, the forty students to be trained at the central school in Madras for the projected collectorate schools. It was considered desirable that the committee accordingly entered into communication with the principal civil authorities in the provinces, and requested them to select two youths from each district—one Hindoo and one Mahomedan, and to send them to the central school to be prepared for the situation of collectorate teacher. To each of these students, during the period of their studentship, a stipend was assigned of Rupees 15 per mensem, being the full amount of salary they were eventually to receive as teachers; the committee being of opinion that this sum was the lowest, which with the reference to the expense of repatriating to the Presidency and the increased cost of living there, would induce respectable natives to join the institution. In regard to the selection of candidates, it was suggested that the persons to be chosen should be respectably connected, about the age of 18 years, and distinguished for good natural talents. In the case of Hindoo candidates a preference was to be given to Brahmins. The committee had not entertained the plan of training teachers at the Presidency for the tahsildary schools, but they looked to the superintendence of the future collectorate teachers as the means of introducing the necessary improvements into the inferior schools. In all their communications both to the Government and to the provincial authorities, the committee laid great stress upon the necessity of securing the sympathy and co-operation of the people. With this view the selection of the masters was left to the principal inhabitants of the towns—a measure which resulted in the appointment of a number of very incompetent persons, inferior to the generosity of the village schoolmasters, and who had nothing to recommend them but their influence with those to whom the election was entrusted, and their inability to provide for themselves in any other way. The salary of the tahsildary teachers was fixed at 5 rupees a month, the amount originally proposed by Sir T. Munro; and on the ground that "the object was to give the inhabitants a good education, and to enable them to get it cheaper than they formerly did," the teachers were restricted from receiving from their scholars any fixed payments beyond "the usual voluntary fees and presents," and were directed to afford gratuitous instruction to such as might be considered to require this indulgence; the decision of this point being left with those members of the village communities who were selected to superintend the schools. In addition to the tahsildary schools in the provinces, of which 61 were eventually established, nine schools under a similar designation were organized in the town and suburbs of Madras, under teachers trained for the purpose in the central school. These schools were subjected to the monthly inspection of the native head masters at the college, and they appear to have been attended with very tolerable success. In them as in the tahsildary schools in the provinces, the instruction imparted was entirely vernacular, the study of English being reserved for the central collectorate schools. (27) *The same; appointment of a Native Education Committee and their proposals.*—It was soon found that no part of the new educational scheme worked well, except the Madras schools. The normal school became very successful, and pupils flocked to it, not to become teachers, but to gain a good English education for themselves. The lower or tahsildary schools in Madras town were also popular and useful, but in the most successful nothing succeeded, as there was no provision for due inspection. In 1834 the Board of Public Instruction proposed that the normal school should be enlarged, that the ordinary school should be separated from it and established as a separate central model school, that the Madras town tahsildary schools should be increased to 20, and that Rupees 800 per mensem should be expended in the preparation of suitable school books. After some months' further deliberation, it was determined that the tahsildary and collectorate schools should be at once abolished, and that the department of public instruction should be entrusted to a board of gentlemen whose other avocations were less onerous than those devolving on most of the members of the College Board. A new committee was accordingly appointed, under the designation of "the Committee for Native Education," consisting of five members, with a member of council as president. The propositions of the new committee were comprehensive. They involved, first, the immediate establishment of four English schools, to be located in convenient parts of Black Town, Triplicane, and St. Thomé; second, the establishment of a normal class for training teachers, as early as practicable, in connexion with the best school at the Presidency, whether a Government school or otherwise; third, the establishment of a college, as soon as the materials for such an institution were to be procured, and the engagement of a well-qualified person to lecture at the college and teach the normal class, as well as to exercise a general superintendence over all the Presidency schools; fifth, the award of premiums to the teachers of the best-conducted schools. The part of the plan which the committee considered to be susceptible of immediate adoption was the establishment of the four elementary schools, from which pupils were eventually to be qualified for instruction in the normal class and in the college. It was proposed that the four elementary schools should be open to all classes, and so located as not to interfere with the English schools already in existence; that each school should have a European head master, with a salary of Rupees 130 together with half the school fees, with an allowance of Rupees 20 for house-rent and a native assistant on a salary of Rupees 50, and that from each pupil a fee should be exacted of half a rupee per mensem, "to ensure regularity of attendance and keep up an idea of the value of education and to leave room for competition on the part of enterprising native teachers." The schools were to be so arranged as to admit of the instruction of from 80 to 100 scholars each. They were to be placed in competition with each other and with other existing schools by periodical public examinations, open to all, at which rewards were to be given to the teacher of the best-taught school, whether supported by Government or not, and it was pro-

maintained from Provincial Funds, supplemented in a few cases by endowments, and in all cases by fees, which are paid into the treasury and credited to Provincial Funds; these are called Government institutions. (b) Public institutions

posed that to the best-taught school of whatever description the normal class should eventually be attached. (28) *Suspension of Government educational measures.*—These proposals were not however taken up by Government. The central normal school alone was re-modelled, the system of gratuitous instruction being abandoned, and each pupil being required to pay a fee of half a rupee per mensem, and also to purchase his own class-books. Affairs remained in this state until 1839. (29) *The Scottish Mission schools.*—Meanwhile a new and very vigorous educational agency had entered the field, for in April 1837 Mr. Anderson opened his school. This was an era in the history of Madras education, and it is necessary to note here the progress of what was first known as the mission of the Church of Scotland and afterwards as the Free Church Mission. This educational agency was one of the last to come into the field, but mainly owing to the great energy and ability of two missionaries, the Revs. John Anderson and William Miller, has grown to be one of the most important in the Presidency. In June 1835 the Rev. Messrs. Bowie and Lawrie, Scotch Chaplains, had established at Madras the St. Andrew's school; and, after collecting funds from friends in the Presidency, they had applied to the Church of Scotland for a missionary, with a view to the establishment of an institution like that commenced at Calcutta by Dr. Duff in 1830. In response to this invitation the Rev. J. Anderson was sent from Scotland in 1836. He proceeded first to Calcutta in order to observe the modes of instruction and discipline at Dr. Duff's institution at that city. After a short stay there he came to Madras in February 1837, and at once set to work. St. Andrew's school was carried on in the compound now occupied by the Government Eye Infirmary. Mr. Anderson urged its removal into the city, with a view to benefit more effectually the dense native community. A suitable two-storied house was hired in Armonian street; and here, on April 3, 1837, he began his labours with 59 Hindoo boys and young men. In January 1839, Mr. Johnstone came to assist Mr. Anderson. His arrival was the signal for an extension of the work, and a branch school was opened at Conjeevaram, in May 1839, with eleven pupils. Mr. Frederick Cooper, Company's Medical Officer at Nellore, had established, some years before, a school for Telooogo and English, and having intimated a desire to connect it with the mission, Mr. Anderson went to Nellore to judge how far it would be advisable to accept the proposal. This led to the annexation of the Nellore school and property to the mission in August. In this year the mission made yet another step. Mr. Anderson was invited by Mr. W. A. Morehead, then Judge at Chingleput, to supply a teacher to the school which he had induced the natives of the place to set up. This led to the adoption of Chingleput as a new branch station. Up to this time the mission had been connected with the Established Church of Scotland, but in 1843 when the Free Church seceded on the question of patronage and State interference, all the Indian missionaries joined the seceding Free Church, and carried with them, after an amicable discussion, the whole of the mission work. It is, therefore, only from 1843 that the Free Church dates, although there was no break in the continuity of the mission. By the end of 1843 the schools had altogether recovered, and their numbers exceeded those of any former year. In February 1845 the Established Church of Scotland re-opened their own mission with a large school, the origin of the institution now on the North Beach, with branch institutions at Vellore and Arcot. This soon became full of scholars without in any way diminishing the number at Anderson's school, so that the cause of education was again benefited. In 1853 Mr. Johnstone died, and similarly in 1855 Mr. Anderson. From that time a great declension fell upon the mission. None could be found to tread in the steps of the founders of the mission. Many took up the task, but the climate and the magnitude of the labours involved caused the retirement of one after another till it was difficult to get any to succeed them. Matters continued unsettled till the arrival of the Rev. W. Miller in 1863. The history of the schools since then is briefly mentioned in the foot-note on Protestant Missions in chapter IX, article Ecclesiastical. (30) *Patcheappah's schools.*—These also call for notice before proceeding to an account of the final arrangements made by Government in development of an educational system. The founding of Patcheappah's schools marks indeed an era in the history of Madras education, as it was the first example of intelligent natives of various castes combining to aid the cause of popular instruction. Patcheappah, in whose name these institutions are founded, was a wealthy Hindoo, who, dying in the last century, left one lakh of pagodas by his will for the establishment of charities, chiefly of a religious character, but in part dedicated to objects of general benevolence. The Advocate-General, Sir Herbert Compton, having discovered that these charities were totally unperformed, and the funds spoliated by the successive executors of his will, filed an information in the Supreme Court, and obtained a general decree against the party finally liable for an account of the fund, to be paid with accumulated interest—amounting to many lakhs of rupees—and also for the performance of the charities. In the whole there were finally collected to the credit of the charities nearly eight lakhs of rupees. A scheme was prepared, whereby, in due accordance with the provisions of the will, and without trenching upon any specific religious or benevolent charities mentioned in the will, it was proposed that all the accumulated sums beyond one lakh of pagodas (that is, upwards of four lakhs of rupees with all accumulating interest) should be devoted to educational establishments in various parts of the Presidency, and particularly at Madras. The scheme provided all details for the quality, localities, subjects of instruction, and governance of these institutions; and they were all finally incorporated in a decree of the court. After some years directions were given, under Lord Elphinstone's government, for the Board of Revenue making such orders as were necessary to carry out the decrees of the Supreme Court and the wishes of the Court of Directors. A school in Black Town was established in January 1842, for affording gratuitous education to the poorer classes of the native community in the elementary branches of English literature and science, coupled with instruction in Tamil and Telooogo. The high school of the Madras University was then in its infancy, and, as according to the rules of that institution, no boy was eligible for admission who could not read English with some fluency, the want of a school of this primary nature was urgently felt by the rich as well as the poor. Further, as the education was imparted gratis, according to the fundamental rules of the institution, the sphere of its usefulness became wider and wider, till its numerical strength surpassed all expectation, and the trustees found themselves necessitated, though unwillingly, to restrict the rapid influx of pupils, and to refuse to listen to pressing demands for admission. It was the original intention of the trustees to establish a few schools in the provinces contemporaneously with the central institution in the Presidency; but circumstances deterred them from engaging in the task. The central school was, therefore, first established and conducted under their immediate supervision. Emboldened by its success, a branch school was then opened at Conjeevaram in the year 1846, on a limited scale, to be extended in case it should work to their satisfaction. There were, in 1855, 64 boys studying in the new school which imparts instruction in English, Tamil, and Telooogo. The branch school at Chidambaram was opened in the year 1850. The number of scholars on the rolls of the institution at the end of 1854 was 65. About the same time that the central institution was established in Black Town an endowment was founded in the high school of the Madras University, with the view of providing education in the higher branches of literature and science to lads in poor circumstances, but deserving of encouragement. Those that enjoyed the benefit of this endowment were divided into two classes, called Patcheappah's Free and Endowed Scholars; the former had their school fee paid from the endowment, and the latter were in receipt of monthly stipends. The trustees also gave great aid to certain vernacular institutions established in and about Madras. These institutions are founded on systematic principles, and afford to the young useful instruction in Tamil and Telooogo, in some instances combined with Sanscrit. The foundation stone of the fine hall of this institution was laid by Mr. George Norton, Advocate-General and patron of these educational charities, in the midst of a vast concourse of the native inhabitants of Madras on the 2nd of October 1846. In the same year the Patcheappah trustees took over the charities of another rich native named Govindoo Naidoo. In 1856 scholarships were given in this benefactor's name at Patcheappah's schools, and later on a separate primary school was opened from the same funds. The new institution was called "Govindoo Naidoo's Primary School," and was opened in 1864. In the year 1869 a third school of equal importance was established by means of a bequest from C. Sreenivassa Pillay, who had been for several years president of Patcheappah's charities. (31) *Summary of the Educational institutions other than those of Government established between 1790 and 1854.*—The

under the direct management of District Boards and Municipalities ("Local Fund Schools" and "Municipal Schools"), or of committees acting under the control of Government, and mainly supported from public funds, Local, Municipal, or Pro-

principal of these may here be summarized. The S. P. C. K. established the St. Peter's schools at Tanjore in 1790; and institutions at Sawyerpoream and Vethiarpooram, in 1844 for training Mission agents. In 1848 Sullivan's Gardens Seminary, Madras, was opened for the training of catechists and schoolmasters. The C. M. S. started an institution for training teachers at Palamcottah in 1836, and what is now the Noble College at Masulipatam in 1841. In 1849 it established also a training institution at the last named station. In 1837 the "General Assembly's Institution" was started at Madras. From this have resulted the "Free Church Institution and Madras Christian College;" and "the Church of Scotland Institution;" with three branch schools of the Free Church established at Conjeeveram in 1839, and at Chingleput and Nellore in 1840. Patchesappah's Central Institution, Madras, supported by funds that had accrued from the accumulated interests on a native bequest for charitable purposes, was established in 1842, under an order of the Supreme Court; with branches started at Conjeeveram and Chidambaram in 1846 and 1850 respectively. St. Joseph's College, Noyapatana, was established in 1845 by the Jesuits of the Madura Mission. In 1851 the Wesleyan Central Institution, Royapettah, Madras, was opened. In 1853 the London Mission established a central school in Black Town, Madras. Two institutions mainly, though not exclusively, for English-speaking boys date from 1836, viz., Bishop Corrie's Grammar school (Protestant); and St. Mary's Seminary (Roman Catholic). Besides the above, there were several schools for English-speaking pupils, many of long standing, as the Military Orphan Asylum, Madras, 1786 and 1788; the Civil Orphan Asylum, Madras, 1815; St. Mary's R. C. Orphanage and day schools for girls, 1840; John Pereira's, Madras, boys and girls, 1840; the Vepery Poor schools, 1841; the Fort St. George Charity school, and the schools at Cuddalore, Triplicore and Vellore mainly for children of pensioners. Among the earliest schools for native girls there were,—the Free Church day school, Madras, 1841; the Free Church boarding school, Madras, 1842; the Church Mission boarding schools in Tinnevely from 1837; the S. P. G. Mission boarding schools in Tinnevely, 1842; the Free Church day schools at Chingleput and Conjeeveram, 1845. The Native Female Education Society's central school, Black Town, Madras, 1845; the Wesleyan Mission boarding school, Royapettah, Madras, 1849.

(32) *Lord Elphinstone's educational scheme.*—In December 1839, Lord Elphinstone, who had succeeded to the Government shortly after the plans of the committee of native education were submitted, brought forward a scheme providing for the immediate establishment of one central collegiate institution, called in the scheme "University," at Madras, and eventually of a set of provincial colleges and schools in connexion with the central institution. The University thus contemplated was to be a teaching body. Lord Elphinstone dissented from the recommendations made by the committee for native education, and his scheme involved its dissolution. It was succeeded by a Board called the University Board. Mr. George Norton, the Advocate-General, a gentleman who had paid considerable attention to the question of native education, was appointed President of the new Board. Mr. Norton was strongly imbued with the necessity of restricting the Government schools in the first instance to the instruction of the higher orders of the native community, and of deferring the adoption of any direct measures for the education of the masses, until an educated class should have been formed among those who were possessed of means and leisure to prosecute their studies beyond the mere rudiments of literature and science. In the words of the address made by the new Board to Lord Elphinstone on the occasion of the opening of the high school, which was penned by Mr. Norton, he and his colleagues were "conscious that their first efforts must be partial and their success very gradual so long as a general ignorance darkens the face of the land. In the joint feeling and co-operation of the higher orders of the native community they looked for the most effectual if not the only support; to their intelligence as testified in their last address they made their constant appeal. The light must touch the mountain tops before it could pierce to the levels and depths." Lord Elphinstone held similar views, but at the same time expressed a concurrence in the opinion of the Governor-General that the elementary education of the mass of the people was not necessarily to be neglected or postponed to an indefinite period. The immediate measure proposed by him for the improvement of education in the interior was the formation at some of the principal towns of superior schools which might be eventually raised into colleges and become eventually the centre of a circle of Zillah schools, as in turn "the Madras University" would be the centre of those Provincial colleges and of the whole system of education throughout the Presidency. The Provincial and Zillah schools were to be connected with the "Madras University" by the establishment of fellowships in the latter institution, to be competed for by the most advanced students of the Provincial schools, and by the foundation of scholarships in the provincial school for the most promising pupils of the Zillah seminaries. In the Provincial schools the English language was to be the medium of instruction, and an acquaintance with it an indispensable qualification for admission, subject to such relaxation at the outset as might be requisite. In regard to the part to be assigned to the vernacular languages in the course of instruction in the several seminaries Lord Elphinstone's intentions were not very clearly expressed. He observed that "the importance of the vernacular languages must not be overlooked. Although I am of opinion that in the Provincial colleges instruction should be given hereafter, solely through the medium of the English language, yet at the first establishment of these seminaries, it may not be possible to insist upon this condition." The want of precision in the views enunciated in this respect attracted the notice of the Court of Directors when the papers came before them, and they disapproved of that portion of the plan which provided for the eventual abandonment of vernacular instruction in the Provincial schools. "We entertain," they said "no doubt however of the desirableness of giving superior instruction in one or more of the native languages in use under the Madras Presidency at the Provincial schools concurrently with English, and we therefore direct that such instruction be adequately provided for in any plan for the establishment of the proposed seminaries." Lord Elphinstone's scheme for the establishment of a University, provided for its division into two departments; a high school "for the cultivation of English literature and the vernacular language, and the elementary departments of philosophy and science," and a collegiate department for the "higher branches of literature, philosophy and science." Of these two departments, the first only could be established at the commencement; the then existing state of education at Madras being such as to preclude the expectation of any students being found qualified for entering upon the course of instruction for which the Collegiate department was designed. One of the first measures of the University Board was to procure the services of a competent person to organize the new institution, and the task of selection having been entrusted to Mr. Mounstuart Elphinstone, formerly Governor of Bombay, Mr. E. B. Powell was appointed to the headmastership of the high school, which was opened on the 14th April 1841. This institution is now known as the Presidency College. In the course of the preceding year, a preparatory school had been opened for preparing scholars for admission into the high school, the rules of the latter institution prescribing that an elementary knowledge of the English language should be an essential qualification for admission. (33) *The University Board.*—The University Board was not a successful institution, and a Council of Education was created to supplement it. This however was dissolved in 1847. The University Board was then re-organized, and "invested with the functions of a Board of General Education" to administer a total of one lakh of rupees. A half of this sum was assigned by the Board to the University (high school), Rupees 30,000 was set aside for five Provincial schools, and Rupees 20,000 was reserved for grants-in-aid. Two Provincial schools were then actually started, one at Cuddalore in 1853, and the other at Rajahmundry in 1854. (34) *Change of views as to educational policy.*—Towards the close of the period ending with the year 1854, doubts began to be entertained as to the soundness of the theory that all education should begin from above and thence descend to the masses. The education of the mass of the people through their own vernaculars, the adoption of a system of grants-in-aid, the avoidance of the establishment of Government schools in such localities as might bring them into opposition to, or rivalry with, other existing institutions; these measures were all advocated as early as 1851. There had also been discussions regarding translations from English works; and some small prizes had been given for their encouragement. However the extent of Government effort up to the close of this period was very inconsiderable. In 1826, as above seen, they had inaugurated 61 schools in the districts, but those they had shortly afterwards closed. The central institution opened at the same

vincial, but in which the fees if any are credited to the local body and not to Government. (c) Public institutions under private management receiving from Government or local Boards (i) salary grants, (ii) results grants, (iii) lump grants,

time for training teachers for the district schools supplied eventually the basis of the Madras High School, the present Presidency College; and this was the most successful of the early operations of Government. The two high schools at Cuddalore and Rajahmundry opened in 1853 and 1854, have since held their ground. There had been brought into existence some Government institutions of a special character, the chief of which were,—“a.” The Madras Medical School, established in 1836, and raised to a college in 1851. “b.” The School of Arts first started in 1850. “c.” The School of Ordnance Artificers in 1840, attached to the Gun Carriage Factory. “d.” A ‘Survey School’ established about 1800. Some small sums were expended in the districts of Chingleput, Nellore, North Arcot and Tanjore, and in the maintenance of a few elementary schools in the hill tracts of Ciamjam. There was no Government agency however beyond this. Of native primary education, connected with Government, there was none. In indigenous education there had been neither improvement nor extension during the thirty years that had elapsed since Sir Thomas Munro’s minute instituted enquiries regarding it. (35) *Directors’ Despatch of 1854*.—This has been mentioned above in the sketch history of education for India generally. (36) *Establishment of Government Department*.—In March 1855, Mr. Alexander Arbuthnot, the Secretary of the University Board, was appointed Director of Public Instruction, and during the course of the year sanction was given for the appointment of four Inspectors of Schools, twenty Assistant Inspectors, afterwards styled Zillah Visitors and now known as Deputy Inspectors, and sixty Sub-Assistant Inspectors called Talook Visitors. The University of Lord Elphinstone was remodelled and received the name of the Presidency College. A Law Class was established as a branch of this institution, and provision was made for a Normal school, for training teachers, four Provincial and eight Zillah schools, a hundred Talook schools, a dépôt for school books, education presses, and Rupees 12,000 for scholarships. To carry out these measures occupied several years, and some changes were made from time to time in the details of the plan originally sketched out. Thus the full number of talook schools was never established, and schools of a somewhat higher grade known as Anglo-Vernacular schools took the place of some of the talook schools. The Madras Normal school was supplemented by Normal schools of a more elementary type in the provinces. A special school for Mahomedans known as the Madrasa-i-Azam was remodelled in 1859. The Provincial school of Cambodiam grew into a college and was formally recognized as such in 1867. The Madras Medical school established in 1836 was constituted a college in 1851 and transferred to the Educational Department in June 1855. The School of Ordnance Artificers, established privately in 1840, was in 1855 constituted a Government institution. At about the same time the School of Arts opened privately in 1850, and the School of Industry similarly established in 1851, became Government institutions and were amalgamated under the designation of the School of Industrial Arts. The Survey School originally attached to the Board of Revenue and afterwards to the Chief Engineer’s office, was constituted the Civil Engineering College in 1868. (37) *The New Madras University*.—The present University of Madras was incorporated by an Act dated 5th September 1857, “for the purpose of ascertaining by means of examinations, the persons who have obtained proficiency in different branches of literature, sciences and art, and of rewarding them by academical degrees as evidence of their respective attainments, and marks of honor proportioned thereto.” The first entrance examination was held in September 1857, and the first examination for the degree of B.A. in February 1858. In 1863-64, an examination called the First Examination in Arts was interposed between the Matriculation and B.A. examinations. The course for the B.A. degree extending over three years, candidates for the B.A. examination were allowed to go up one year after matriculating. But the interval between the Matriculation and B.A. examinations was afterwards extended to two years, so that those who matriculated in 1869 could go up for the B.A. examination only in 1871. (38) *Grants-in-aid to Private Schools*.—The first Government Grant-in-Aid rules, that is to say, rules for regulating State aid given to private schools, were published in 1855, simultaneously with the arrangements above mentioned for the establishment of a purely Government department. The rules were couched in very general terms, but embodied some important principles. They provided that the grants were to be for a definite purpose, mainly for teachers’ salaries, and that they were not to exceed in amount the sum contributed on the part of the school itself, that is to say, from fees, endowments, &c. Except in the case of normal and female schools they were to be confined to schools in which school-fees were levied. Every aided school was to be under Government inspection, and no teacher was to receive a grant until his qualifications had been reported on by a Government Inspector. Experience showed that more definite rules were needed, and in 1858 a new code appeared. It was to a large extent an adaptation of the old English Code. Its main feature was an elaborate system of teachers’ certificates in connection with the salary grants. Nine standards of qualification were laid down for schoolmasters and five for schoolmistresses, and for each standard there was a departmental examination. To each class of certificate a specific grant was attached, which represented one-third of the teacher’s salary. These rules were superseded by a third code which came out in 1865, which has recently been superseded by the code of 1885. In the code of 1865 the number of grades for schoolmasters was reduced to five, and for schoolmistresses to three. The maximum grants claimable under these rules were made much higher than they had been before, representing one-half instead of one-third of the salaries of teachers. The University B.A., F.A., and Matriculation examinations were substituted for the departmental examinations for the three higher grades, the departmental examination in these grades being confined to a paper in method and teaching a class in the presence of an Inspector. Grants again were made claimable under the code for various purposes besides salaries, such as the erection and repair of buildings and the purchase of furniture, school apparatus, and books. Grants could also be claimed as an alternative in elementary schools on the payment for results system, but the standards for native schools were pitched so high that this portion of the code remained at first inoperative. A new set of results rules came out in 1868, another set again on 1st April 1878. The radical changes were introduced in 1884 in connection with Eurasian education. The present code came into force on the 1st July 1885. The Madras result rules are with many important differences based on what is known as the Mendella code, but many of the distinctive characteristics of the code have been retained in a modified form. They seem well adapted to the educational requirements of this Presidency. Large numbers of indigenous as well as mission schools in every district have been improved on the results system either in its simple or its modified form of a combination of salary and results grants and it has almost entirely superseded the salary grant system in elementary schools of all classes. Schools aided on the results grant system generally receive no aid except a result grant once a year. A still further modification of the original grant-in-aid system has of late been allowed to grow up in the form of what is known as the “combined” system, consisting of part fixed salaries and part results grants under the rules. This was originally applied to the Local Fund middle schools of Malabar. According to this plan which has now been incorporated in the code a proportion of each teacher’s fixed salary was taken and made to depend on the result of the annual examination of the school. His regular salary was reduced, but if he exerted himself, he might eventually get something more than he would have otherwise drawn. In May 1873 this scheme in a somewhat different form was applied to the Local Fund primary schools of the same district. The indigenous teachers were in this case to be trained men, and to receive a monthly stipend of Rupees 4 with full results grants in addition to such school-fees as they could collect. In July 1874 a somewhat similar scheme was sanctioned for the middle and primary schools of South Canara, but under this arrangement the indigenous schoolmasters were to receive Rupees 6 instead of Rupees 4 a month. Various other schemes on the combined system, differing not only in their details, but in their fundamental principles, have been since sanctioned or proposed for different parts of the Presidency. In some districts full results grants are given in addition to salaries of varying amounts; in others only half results grants are given; in some the amount drawn as salary is deducted from the result grant, and is thus a mere advance to be eventually refunded. In some districts the fees belong to the teachers, in others to the Local Fund Boards. In some districts buildings and furniture are provided by the Boards, in others by the teachers. In some districts schools on the combined system are regarded as Local Fund schools, in others as private schools. In the new code the system is fixed by requiring

or (iv) aid on the combined system, supplemented in most cases by fees from parents, and in some cases by private subscriptions and endowments; these are called "aided schools." (d) Public institutions under private management which although under inspection do not receive aid from public funds.

schools to be aided thereunder to comply in most respects with the conditions laid down for the issue of salary grants in regard to the fixed portion of the teacher's stipend. The three main systems of aid are then the salary grant system, the results grant system, and the combined system. The pure results grant system is considered to be chiefly adapted for the promotion of education in backward parts of the country and among the ruder classes, where the advantages of a less mercenary and purer method of State aid would meet with no appreciation. The salary grant system is regarded as the most suitable where public opinion is active and where confidence placed in teachers will meet with response. The combined system occupies in principle a ground intermediate between the other two, and may probably be relied upon for all intermediate sets of circumstances. It is especially adapted to schools for the poor. The description of the different forms of State aid given to private schools will not be complete without mentioning that in a few cases lump grants and special grants are given by Government; these, however, are quite exceptional. In speaking of State aid in this paragraph it must be understood that the term includes the aid given by various Municipal and Local Fund Circle Boards, which are in fact quasi-Government institutions. The grant-in-aid rules were originally drawn up to regulate aid given by the Government itself, but the Boards just mentioned have been required to adopt the Government rules. (39) *Madras Act VI of 1863*.—After the grant-in-aid system of 1855 had been in force for some years, it became apparent that however useful it might be in improving higher and middle class schools, it had been doing up to that date very little for elementary education in consequence of the limited number of applications made from elementary schools. In 1863 the Madras Education Act was passed. The object of this measure, which was based on the Municipal Act XXVI of 1850, was to provide a proper machinery for the collection and management of a rate, by which certain village schools in the subdivision of the Godavery district were supported, and to furnish the inhabitants of towns and villages in other parts of the Presidency with the means of raising permanent funds for the establishment of new and the improvement of existing schools and of availing themselves of the grants-in-aid which Government were prepared to give. The Act provided that if the majority of the rate-payers in the Godavery district did not petition against the continuance of the schools within two months from a given date, the schools should be continued for five years, and that a similar procedure should be observed at the end of every recurring period of five years. In any district the inhabitants might petition for an order declaring the Act in force in any town or village, and the order was to be issued if, after enquiry, a sufficient majority of the inhabitants was found in favour of the application. When however the Act came to be worked, it was found to be ill-adapted to rural communities. The Godavery Commissioners were inexperienced ryots, who knew little or nothing about the management of schools. The collections fell in arrears and the teachers remained unpaid for long periods. In the other districts very few schools were established, and in many cases after the Act had been put in force with the apparent assent of the inhabitants, it was found necessary to close the schools or to abandon the attempt to establish them. At the end of seven years the Act had been brought into operation in only nine out of nineteen districts, and the total number of rate schools was only 104. In the Godavery district the number had dwindled down to fifty-nine, in the other districts it ranged from two to seventeen. Among these were two important schools of the higher class at Palghat and Sydapett. Except in the Godavery district, the other schools were almost entirely middle-class schools. Thus the experiment of extending an interest in education by means of a voluntary rate met with little general success. (40) *Madras Act of 1871*.—The only alternative was a compulsory cess. So far back as April 1868 the attention of the Government of India and of the several local Governments had been drawn by the Secretary of State, to the expediency of imposing a compulsory rate to defray the expenses of schools for the rural population. The measure was not at that time approved by this Government at Madras. In May 1868 the Government of India pointed out that Act VI of 1863 had entirely failed in the main object for which it was passed, and suggested for consideration the introduction of a cess on the model of the one which had proved so successful in Northern and Western India. The necessity for supplementing Imperial revenues by local taxation had long been felt in this Presidency, and various local Acts were already in operation under which the conservancy of the principal towns and the formation and maintenance of district roads had been provided for by local taxes. The embarrassed condition of the finances of India, which became known in the following year, although it was not, as was popularly supposed, the immediate cause of the enactment of the Towns Improvement Act III of 1871, the Local Fund Act IV of 1871, and the Madras Municipal Act V of 1871, rendered it impossible to defer this class of legislation any longer, and those Acts were accordingly passed, providing among other things for the promotion of education in towns and country. The provisions of the Acts with their recent successors and the nature of the taxation levied under them are fully described elsewhere in this volume. The description of education to which Local and Municipal Funds were applicable was purposely left undefined in the Acts. Government have, however, since decided that these funds shall be mainly appropriated to the maintenance and improvement of "elementary" education. The exceptions which have been allowed are the rate schools of the middle class established under the Madras Education Act, institutions for medical and technical training, and certain schools which have been dealt with as exceptional cases. It was originally intended that one-fourth of the cost of all Government Normal schools should be debited to Local and Municipal Funds, but it was found that some of these schools supplied few or no teachers to elementary schools, and it was considered inequitable to throw any portion of their cost on Local or Municipal Funds. This part of the scheme was therefore carried out only with reference to a few Normal schools, and circumstances occurred which rendered it of very short duration even in this limited form. In the years 1871-72 and 1872-73 three hundred and twenty-three Local Fund schools had come into existence, and the house-tax under the Local Funds Act had been imposed in a corresponding number of villages or groups of villages. But the imposition of this tax encountered in several instances such extreme hostility, that Government determined that it should proceed no further. As the effect of this order was to leave charges for sanctioned "Union" schools unpaid for to an aggregate amount of Rupees 1,10,000, a special grant was made from Provincial Funds to the circles concerned to supply such deficiency as could not be met from the unallotted balance of the General Fund of each circle. Since 1873-74 Local Fund Circle education has been developed without the aid of a house-tax. It was calculated at the end of 1873-74 that, including the one-third land-cess, the General Local Fund might be estimated at about 14½ lakhs, of which 5½ lakhs were allotted as an additional contribution to the Road Fund, and three-quarters of a lakh were given as a contribution towards the pay of the Deputy Inspectors and the cost of Normal schools. From the commencement of 1874-75 it was resolved that no contributions should be made from the one-third land-cess to the Road Fund until the requirements of the other purposes to which the General Local Fund might by law be applicable had been fully met and that all charges on account of Deputy Inspectors and Normal schools should be resumed 'in toto' as a provincial charge. The general effect of these measures was to place about eight lakhs and a half at the disposal of the Local Fund Boards for elementary education. In December 1874 the Local Fund Boards and Municipalities were further relieved at option of all charges connected with female education, and a few girls' schools which had been

colleges, high schools and middle schools. (42) *Recent Progress*.—During the last few years the progress of education has been satisfactory, whether in State schools, in Local Board schools, or in schools under private management aided by the State and Local Boards. Colleges and high schools have been increasing in numbers and efficiency. The Rajahmundry College, the Madras Christian College, and St. Joseph's College, Negapatam, are now first-grade colleges educating up to B.A. degree. The number of second-grade colleges, educating up to the F.A. standard, is

761. The Government institutions entered in the last paragraph as class (a) comprise institutions of every educational standard. In the first place come three first-grade colleges at the Presidency town, Combaconam, and Rajahmundry; and seven second-grade colleges at Bellary, Berhampore, Calicut, Cuddalore, Madura, Mangalore, and Salem. There are eight high schools appertaining to these colleges. In the current year the colleges at Bellary and Salem will be transferred to the Municipalities concerned. There are also first-grade high schools at Chittore, Cuddapah, Kurnool, and Sydapett, and second-grade high schools at Cannanore, Chicacole, and Goontoor. All the high schools above-mentioned have middle schools, more or less complete, attached to them. Excepting the high school constituting a part of the practising branch of the Government Female Normal School, Madras, there is no Government girls' school of the high school standard. The Government middle schools for boys have been transferred either to the Municipalities or the District Boards concerned, with the exception only of Goonapore and Bhadrachellam schools. There are thirteen Government middle girls' schools; at Chidambaram, Combaconam, Cuddalore, Carootattangoody, Moolapett, Naidoopett, Nellore, Ossoor, Ongole, Poodocottah, Salem, Vellore and Vriddhachellam. There are twenty-two primary schools for girls maintained by Government, besides the primary departments attached to superior schools. There are five Government Normal schools for masters; namely those at Madras, Narsapore, Russellcondah and Tellicherry with the Mahomedan Normal school at Madras. The Madras General Normal school trains teachers of the first, second and third grades, while the other normal schools are elementary in their character and train fifth-grade teachers. Special normal classes are also attached to the Bhadrachellam and Goonapore middle schools. There are two normal schools for mistresses, one at Madras and the other at Coimbatore, and there is besides an experimental normal class in connection with the Government Girls' School, Chicacole. A few schools or departments of schools have been specially established for the Mahomedan community. Of these the most important is the Madrissa-i-Auzam, a second-grade high school at the Presidency town. The Mahomedan Anglo-Vernacular School at Mylapore has recently been reduced to the primary standard. Elementary schools for Mahomedans were opened a few years ago at Adony, Arcot, Cuddapah, Ellore, Kurnool, Masulipatam, Nagore, Rajahmundry, Trichinopoly, and Vellore; and several of these have already developed into ordinary middle schools. The Arcot Mahomedan school has since been closed on the re-organization of a Yeomiah school under the control of the District Board; while the remaining schools have been handed over to the Municipalities concerned, except those at Cuddapah and Kurnool which are about to be handed over. At Cuddapah and Kurnool it has been found expedient to amalgamate the Mahomedan school with the other Government school, of which it now forms a department, and at Chittore a Mahomedan department has been recently added to the Government school. In all these

annually increasing, and there are now only seven districts unprovided with a college. The rates of school-fees have been four times raised, and many of the high schools are beginning to pay half and even a larger proportion of their cost by means of school-fees. Middle-class education has improved in the Government schools, but is on the whole in a less satisfactory state in aided schools. The high schools are stimulated and improved by the University examinations. The primary schools come under the influence of the examinations for results grants. Middle-class schools have suffered from the absence of a public test examination answering to their educational standard. This was accordingly instituted in 1879. Recent progress however has been most marked in the case of elementary education. The growing attendance at many Government schools in the mofussil has rendered it necessary in the past two or three years to abolish the primary departments in order to prevent undue crowding and to set the funds at disposal of Government to strengthen the teaching staff of the middle and high school departments. But Municipalities and Local Fund Boards have stepped in and assumed new responsibilities as the promoters of elementary education. The existence of these schools tends to develop an interest in education among the native members of Commissions and Local Boards and is an unmixed advantage to the population concerned, who if the fees are low soon learn to send their children to well-conducted public schools instead of to small and inefficient verandah schools. Again there has been a great increase in aided institutions, the number being 4,625 in 1879-80 and 5,845 in 1880-81, against only 2,414 in 1870-71. The increase here mainly confined to small village and verandah or pyal schools, either of long standing or of recent origin, which have gradually been brought under the influence of the educational system. There has also been an increase in the number of unaided schools under inspection. In the ten years ending 1879-80, the number of pupils receiving elementary education in schools connected with the department increased from 90,605 to 247,471, the proportion of pupils to the population calculated per hundred being 7914 against 2894. In the year 1884-85, the number had risen to 395,374, and the proportion to population on the census of 1881 to 12808. The proportion of pupils in towns during this period has advanced rather more rapidly than in rural tracts, though the difference is not great. The steps recently taken for promoting female education are mentioned in the text. During the ten years 1875-1885 the number of girls receiving instruction in the Presidency rose from 19,582 to 50,919. The number of women presenting themselves for the Departmental Certificate examinations afford a rough guide to the progress of female education above the elementary grade, and the increase here has been very great. The general facts however relating to recent progress in education can be seen from the comparative statistics in the text.

Mahomedan schools instruction is imparted through the medium of Hindostany except at Nagore; where Tamul is the vernacular of the Lubbay boys, by whom the school is attended. There are twenty-seven Government primary schools in the hill tracts of Goomsoor and Pedda and Chinna Kimeddy, one primary school in the hill tracts of Vizagapatam, and thirteen primary schools for boys in the Rekapully and Bhadrachellam talooks; all these for Ooriya, Khonds, and hill tribes.

762. In class (b) of the above classification or quasi-Government institutions, there are for boys three Local Fund and seven Municipal high schools and one hundred and ten Local Fund and nineteen Municipal middle schools. With three exceptions English is taught in each of these schools. Most of these correspond with the schools hitherto known as Anglo-Vernacular and talook schools, but a few are purely vernacular schools. According to the returns for 1884-85 there are 1,014 primary Local Fund schools and 80 primary Municipal schools. It is optional with the Local Fund Boards to allow English to be taught or not, but most of the schools are vernacular schools, and there are few in which the highest class rises above the third results standard. Girls are not excluded from these schools, and the number of such attendances is increasing. There are four Municipal and two Local Fund middle schools and eleven Municipal and twenty-seven Local Fund primary schools for girls. The Local Fund Boards maintain also with aid from Provincial Funds thirty-two normal schools for masters and one normal school for mistresses and three medical schools. The Madras Municipality has an elementary normal school of its own. Theoretically these schools are managed by the Local Fund Boards with the aid of the Inspector of the division; in practice the tendency of the system is to throw all administrative details into the hands of the Deputy Inspectors. A few of the Municipal schools are schools for special classes, such as Mahomedans, East Indians, silk-weavers, &c., but the majority of them are for all classes, and in large towns they act as feeders to the more advanced schools, and do some of the work which used to be formerly done in the primary departments of those schools. The attendance in some of these schools is tolerably large, ranging between one and two hundred, and a few of the best schools are beginning to realize a large income from school-fees. The number of Municipal schools is increasing, but some towns prefer to work entirely on the grant-in-aid system, especially that of results. In the town of Madras this is exclusively the case in regard to poor schools aided from Municipal funds. English is taught in many of the Municipal schools, which thus act as supplementary to more advanced schools. The Lawrence Asylum at Ootacamund is the only institution answering to the description of a quasi-Government institution worked by a committee and other than a local Board school.

763. With regard to class (c. i) of the classification salary-grants are given from Provincial Funds to 18 colleges, 61 high schools, and 31 middle schools for boys, and to 94 schools for girls; also to the primary schools which form departments of these colleges and schools except in the case of middle and primary departments of superior institutions for boys in Municipalities, these charges being borne by Municipal Funds. Salary-grants are rarely given to any other primary schools than those just mentioned, but if given they are paid from Local or Municipal Funds. With regard to class (c. ii) results grants earned by boys under the fourth, fifth, sixth and seventh standards and by girls under all the standards are paid from Provincial Funds and under the three lower standards from Local or Municipal Funds; except in the town of Madras where the results grants of poor schools under all four standards are paid by the Municipality, and the results grants of other schools fall entirely on Provincial Funds. With regard to class (c. iii) certain rate schools originally established under the Madras Education Act, and afterwards transferred to Local Fund Board and Municipalities, and certain middle schools which had been aided on the salary-grant system previous to their transfer to the Local Fund Boards, received till lately lump grants from Provincial Funds. Since the introduction of new grant-in-aid code however lump grants to individual schools have been discontinued; special lump grants only being given to certain Boards where the finances do not admit of adequately meeting the

765. The statistical abstract at foot [3] shows the progress in the number of schools and pupils on the books under each of the above four heads during a period of ten years. The next statement [4] shows the number of Government and quasi-Government institutions in 1874-75, 1879-80, and 1884-85 arranged by their educational standard which will be mentioned hereafter. In this table the school departments of colleges and practising departments of normal schools are counted separately, while the middle and primary departments of high schools and the primary departments of middle schools are not so counted. This mode of tabulation has been rendered necessary by the fact that the reports for certain years of the decade treated a school with all its departments as one school. The

next table [5] gives similarly the number of all classes of non-Government institutions, aided and unaided. It appears, from these tables, that there was considerable progress in the number of institutions of all kinds during the decade. The falling off in the number of middle schools, both for boys and girls, in 1879-80, is only apparent, as in and prior to 1874-75 the line of demarcation between middle and primary schools was not clearly drawn. With a clearer definition of the standards of instruction, it was necessary to class many so-called "middle" schools as primary schools. Madras is the only town in which a Government and an aided first-grade college exist side by side. In the Tanjore district the Government college is located at Combaconam, and the aided college at Tanjore. The total number of aided colleges exceeds the number of Government colleges by eight, and there are, besides, two unaided colleges, one at Vizianagram and the other at Calicut. The total number of aided and unaided high schools is 94 against 16 Government high schools. The aggregate number of aided and unaided English and Vernacular middle schools is 343 against 3 Government and 129 Board schools of the same class. The number of primary schools for boys, English and Vernacular, is 12,989 non-Government against 56 Government and 1,094 Board institutions. The next abstract statement [6] gives the total number of pupils actually attending school in Government and private institutions on the 31st March 1875, 1880, and 1885. The next statement [7] shows the annual amount of general grants-in-aid from Provincial funds including building grants during the same period. These grants, it may be mentioned, are for high, middle and female education hereafter to be explained and include the result grants hereafter to be explained paid from Provincial funds for all the results grants standards above the third, which is the superior limit of lower primary or elementary instruction. The grants given

from Local and Municipal funds are given below.^[8] But these are only approximate. They have been taken from reports of the department which do not in many cases profess to give the entire financial statistics of Local Fund Boards; and they are thus rather below than above the mark. These grants are mainly for elementary education. The gross expenditure on education for ten years is summarized below.^[9]

766. DESCRIPTION OF EDUCATIONAL INSTITUTIONS ACCORDING TO TEACHING.—The classification of educational institutions given in the remarks of the last four paragraphs has been a financial one, made with reference to the sources from which those institutions are supported. With reference to the nature of the instruction given, the Government institutions range themselves, according to the teaching standard and the classes they contain, in the order shown in the table below.^[10] The three general heads of University, Secondary, and Primary education explain themselves. The meaning of the table as to classes is that those shown under each head are not to be found in any head lower in the scale; and that a student proceeding through the whole educational course (say during thirteen years, one for each class), would have to pass through all the classes and institutions there specified. No single institution has all the classes here enumerated. On the other hand it is not unusual for an institution to be divided into branches representing different parts of the scheme, all being in the same building and under the same management; thus every college has a school attached to it, and most high or middle schools have one or more primary classes working under the same roof. The meaning of the classes themselves is primarily that in each class such and such a curriculum of study is pursued. Of late there has been an increasing tendency to separate off the classes by actual test-examinations prescribed and conducted by

central authority, and where this is the case a student cannot enter any class or pass to it from one lower without first having passed the corresponding examination. This rule is enforced in all institutions under the direct management of the department and exemptions can only be sanctioned by the Director of Public Instruction. The above remarks are in the main applicable to private schools of the same educational standard receiving aid in the form of salary-grants from public bodies. The adoption of departmental restrictions however in regard to class promotion is voluntary in aided institutions. Private elementary schools receiving pecuniary assistance from Municipalities and Local Boards on the results system are technically classed as upper primary or lower primary according as they pass boys under the fourth standard results examination or only under the three lower standards. The following remarks give further detailed information as to these teaching classes, curricula, and test-examinations.

767. The highest or tenth class of the scheme in foot-note [10] takes its name from the B.A. examination and degree of the Madras University, for which it prepares students. The B.A. test is shown in Vol. II, App. XCVI; and the curriculum consists in preparation for that test. Under the rules of the University a student must have passed the F.A. University examination, or First Examination in Arts, before appearing for the B.A. examination; but there is no special departmental test to regulate promotion to the tenth class from the ninth class next below it, that being regulated within the institution concerned. The ninth or Preparatory B.A. class prepares pupils for the B.A. test and finishes a part of the B.A. curriculum. A student does not enter it unless he has passed the F.A. University examination. The eighth or F.A. class takes its name from the F.A. examination of the Madras University for which it prepares students. The F.A. test is shown in Vol. II, App. XCVI, and the curriculum consists in preparation for that test. There is no special departmental test to regulate promotion to the eighth class from the seventh class next below it, that being regulated within the institution itself. The seventh or Preparatory F.A. class prepares pupils for the F.A. test by finishing a part of the F.A. curriculum prescribed for the year. To enter an arts college at all a student must first have passed the University Matriculation examination; this rule being absolute. English is exclusively used as the vehicle of instruction in collegiate classes. The course in the seventh and eighth classes occupies properly two years, and that in the ninth and tenth classes two years more. The age for entering an arts college is usually from sixteen to eighteen years. The remarks above made for Government colleges apply in the main to all colleges. The statement at foot [11] shows

between 1872 and 1881, 49 in mofussil courts and 77 in the Madras High Court. Of these, several have become District Moonsifs, and one is a Judge in Travancore.

768. The sixth or Matriculation class of Government schools takes its name from the Matriculation examination of the Madras University, for which it prepares students. The University test is shown in Vol. II, App. XCVI, and the curriculum runs parallel. The examination is held at the following stations:—Bangalore, Batticaloa, Bellary, Berhampore, Calicut, Chicacole, Coimbatore, Combaconam, Cuddalore, Cuddapah, Ernacolum, Hassan, Hyderabad, Jaffna, Kurnool, Madras, Madura, Mangalore, Masulipatam, Munnargoody, Mysore, Negapatam, Nellore, Ootacamund, Palamcottah, Rajahmundry, Salem, Shimoga, Tanjore, Tellicherry, Trichinopoly, Trincomalee, Trivandrum, Tuticorin, Vellore, and Vizagapatam. The fifth class has a curriculum as shown in the same appendix. It is tested by a quasi-public examination called the Fifth Class Departmental Comparative examination. This test is conducted by the Director of Public Instruction with the assistance of Inspectors of Schools and masters in second-grade colleges and high schools and the examination is held in the local high schools. Ordinarily a head master of a Government school is not permitted to promote a boy into the sixth class until he has passed this examination. In the high schools all scholars read English as a subject; and about one boy in five a classical native language similarly. Instruction in the high school classes is almost wholly imparted through the medium of English. There is no high school in the Presidency, in which instruction is given entirely through the medium of the vernaculars. The period during which a student should properly remain in the fifth and sixth classes forming the high school branch of secondary education is two years, but the majority of students take three years after passing the Middle School examination to pass the Matriculation examination.

769. The upper fourth, lower fourth, and third classes of Government schools, forming the middle school branch of secondary education, have similarly the three curricula shown in Vol. II, App. XCVI. The upper fourth is tested and promotion from it is regulated by the public Middle School examination. The Middle School examination of the educational system has since 1879 been utilized by the Government for testing the eligibility of candidates for the public service; non-students being admitted to it. For this see para. 756. It has also taken the place of the former fourth-grade certificate examination for masters and second-grade examination for mistresses. With this three-fold application, without reckoning examinees from aided schools hereafter to be mentioned, the number attending the examination is very great. In 1884, 8,358 candidates altogether were examined, and 4,895 altogether were passed. About half the examinees in this examination are Brahmins. The test appears in the Fort St. George Gazette of 24th February 1885. The examination is conducted by the Commissioner for the U.C.S. Examinations who is assisted by a Secretary and is held at the following stations:—Alleppey, Anantapore, Bangalore, Bellary, Berhampore, Bezwada, Bhadrachellam, Bimlipatam, Calicut, Cannanore, Chicacole, Chidambaram, Chingleput, Chittore, Cocanada, Cochin (Ernacolum), Coimbatore, Combaconam, Conjeeveram, Cottayam, Cuddalore, Cuddapah, Dindigul, Ellore, Erode, Goontoor, Hassan, Hyderabad, Kurnool, Lovedale, Madanapully, Madras, Madura, Mangalore, Masulipatam, Mayavaram, Munnargoody, Mercara, Mysore, Nagarcoil, Namcull, Narsapore, Nazareth, Negapatam, Nellore, Ongole, Oodamalpett, Oosoor, Ootacamund, Palamcottah, Palghaut, Poodocottah, Rajahmundry, Ramnaud, Salem, Sawyerpooram, Shimoga, Shivagunga, Shreevillipoottore, Sydapett, Tanjore, Tellicherry, Tinnevely, Tranquebar, Trichinopoly, Tripatty, Trivandrum, Trivellore, Tuticorin, Veeraraghavapooram, Vellore, Vizagapatam, and Vizianagram. The lower fourth is tested and promotion from it is regulated in Government schools by the Lower Fourth Departmental Comparative examination, which is conducted by the Inspectors of Schools and is held in the local schools themselves. For the third class there is no test examination, other than that of the Inspector's visits. In middle schools almost all scholars take up English as a subject, and about one in eight a classical native language similarly. In some schools the classes here specified are styled vernacular as teaching through the medium of the vernaculars

reading. The elementary prose readers are studied on account of the general information they convey as well as for their language and style. Poetry is begun in preparatory class B, the higher of the two preparatory classes, and is continued in the two classes next above that. Arithmetic is taught on the English system with English figures, but through the medium of the vernacular with tables of Indian weights and measures and money. Daily instruction is given in this subject. Children between nine and ten are considered to be old enough to learn the compound rules, and those between ten and eleven are considered to be old enough to learn vulgar fractions. They begin by working sums in these rules; the application of the rules to miscellaneous questions comes later. Map-drawing is practised in elementary as well as other classes, and the study begins with the geography of the neighbourhood and general notices of the world. General principles of hygiene are taught in the second class, and those of agriculture in the first and second. In the practising branch of the Madras Female Normal school, instruction is given in the Kindergarten system and also by object lessons. The object lesson system is also in force in some girls' schools in Madras town. The Upper Primary public examination tests the work of the highest of the Government primary classes, called "second class," and passes students from it into the middle school. The Upper Primary examination includes three compulsory subjects, and any two of five optional subjects. The compulsory subjects

are:—reading at sight with fluency and intelligence, and writing to dictation; arithmetic, including compound rules, vulgar fractions, and mental arithmetic applied to bazaar transactions; geography of Asia. The optional subjects are the following:—a vernacular language—recitation, 200 lines to be brought up, and ability to answer questions on the meaning, subject-matter and grammar; a second language—reading and construing, dictation and oral translation; history—India, England, or the World's history; hygiene; agriculture. The examination is conducted either by the Inspecting officers at the time of their visit or by the heads of institutions concerned. The Lower Primary public examination tests the work of the first class, and passes students into the second class. This test is as follows:—to read at sight with facility a moderately easy book in a vernacular language; to write to dictation from the same; to work sums in the first four rules of arithmetic, simple and compound, including easy miscellaneous questions. The test is conducted either by the Inspecting officers or by the heads of schools concerned.

773. In salary-grant aided primary schools the classes and curricula are much the same as in Government schools, though different text-books are often used. The upper and lower primary examinations also are held in these schools. The classes of results-grant primary schools are much the same as the four Government classes; but they are called fourth, third, second and first standard classes respectively, working directly for those grant-in-aid examinations. Needlework is taught in all girls' schools by a tailor or sewing-mistress.

774. The statement at foot [19] shows particulars of primary instruction in connection with the department for 1884-85; and the next statement [20] shows similarly the number of such schools in the different districts. There were thus in all 14,299 schools in 1884-85, or one school for about every 2,160 people, or one school for every 320 children of school-going age; or considering that few of the schools are girls' schools, about one school for every 160 boys. As to the distribution of the schools within each district, the number of schools varies with the prosperity of the people. In Coimbatore, for example, the schools are thickly scattered along the valley of the Cauvery, whilst they hardly exist in the poorer and drier parts of the district, where the villages are small. Again in Tanjore, in the delta talooks, schools abound; in the dry cultivation talooks in the south of the district they are scanty. The same is the case in Tinnevely and Trichinopoly. Ordinarily where there are Brahmins there are schools. The number of scholars

in schools connected with the department receiving elementary education in 1884-85 was 395,374, and the proportion to population on the census of 1881 was 1·2808. The proportion of pupils has advanced of late more rapidly in towns than in rural tracts, though the difference in the two cases is not great. The proportion to population is highest in the towns of the Nellore district, viz., 7·1286; next in the Coimbatore district, viz., 5·7546; next in Tinnevely, viz., 5·3578; next in the Kistna district, viz., 5·1302. There are three districts, one being Madras, in which the percentage is between 4 and 5. The next statement ^[21] shows the number of pupils learning English, a classical native language, and a vernacular native language in the different primary schools on the 31st March 1885. The next statement ^[22] shows the success of examinees in the different examinations belonging to the primary system in 1881-82; in these the results examinations are included.

775. The progress made in each grade of education during ten years is seen from the statistical abstract at foot.^[23] The most noticeable feature in the tabulation is the great advance of primary education; from 8,306 boys' schools with

1884-85	13,720	579	314,316	38,434	

199,797 pupils to 13,720 schools with 314,316 pupils, and 220 girls' schools with 7,924 pupils to 579 schools with 38,434 pupils. The expenditure on elementary education from provincial revenues only on each grade of education (omitting professional colleges) for a recent decade was as at foot. [24] During these ten years Government expenditure on university education in Government institutions rose from Rupees 64,600 to Rupees 1,22,000, and in aided colleges from Rupees 8,700 to Rupees 23,500. On secondary education in Government schools the outlay rose from Rupees 90,000 to Rupees 1,09,000, while in aided schools it fell from Rupees 1,90,000 to Rupees 90,000. Government primary schools cost Rupees 75,925 in the last year against Rupees 35,691 in the first, while the Government expenditure on aided primary schools rose from Rupees 1,00,000 to Rupees 1,07,000. In the same ten years, the expenditure on aided primary education from Local and Municipal funds increased from Rupees 87,619 to Rupees 2,12,576. The total aid to primary education from Public funds amounted to Rupees 3,20,010 in the year 1880-81.

776. DETAILS OF THE GRANT-IN-AID CODE.—The grants-in-aid mentioned above are given under three systems :—(a) By a graduated portion of total salary ; (b) by payments for results obtained at the annual inspection ; (c) by a combination of these two systems. The following is a brief sketch of the code.

777. The following are the conditions of the salary system. (a) The management must consist of one or more persons, who will answer for the permanence of the school for a given time. (b) The managers must agree to submit their school to inspection in all matters concerning secular instruction and general management ; fees at prescribed rates must be levied ; the percentage of free scholars is limited ; a suitable building must be provided ; the average attendance must not ordinarily fall below thirty in the case of boys' and twenty in the case of girls' schools, schools for poor Europeans in small towns and schools intended mainly for the less advanced and indigent classes or situated in backward localities being exceptionally treated as regards minimum attendance ; teachers must devote ordinarily four hours a day to secular instruction, three hours being required in the case of teachers in college classes and of headmasters of secondary schools and assistant professors, and two hours in the case of principals of colleges with secondary schools attached. (c) Grants above 15 rupees are sanctioned by the Director, not exceeding 15 rupees by the Inspector. Teachers may have leave on half pay if the leave is taken in general accordance with the provisions of the Civil Leave Code applicable to Government Educational officers of similar standing. Salary-grants are paid monthly and the aid granted must not exceed the annual sum necessary to make good the difference between fee and endowment receipts and the total expenditure. (d) Grants vary first according to general standard of educational qualification of the teacher, and each general standard according to whether a teacher has (i) been trained in a normal school, (ii) passed the prescribed examination in method and teaching, (iii) passed the general standard test of the grade. For both male and female teachers there are three grades of certificates ; collegiate, secondary and primary. The general education test for the collegiate grade is the Degree in Arts in an Indian University ; for the higher secondary grade the First Examination in Arts in the same institutions ; for the lower secondary grade the Entrance Examination to the same institutions or the Higher Examination for Women ; for the higher primary grade a first or second

class in the Middle School examination, the first class being also the general test for admission to the public service; and for the lower primary grade, a third class in the Middle School examination or a special examination, which embraces an elementary knowledge of English or of a vernacular, or of both; of writing, dictation, composition, grammar and poetry; of arithmetic to vulgar fractions inclusive; of geography, general, and the Madras Presidency; and two of the following optional subjects—History of India, hygiene, agriculture, needlework (for female candidates). The teachers, male or female, educated in Europe or America, are graded according to circumstances by the Director of Public Instruction. The tests in school management are shown in an appendix to the Grant-in-aid Code. Salary-grants for male teachers are ordinarily calculated according to the following maximum scale of salaries:—(i) Principals of first-grade colleges, Rupees 400 to 600. (ii) Professors of first-grade colleges, Rupees 250 to 500; Principals of second-grade colleges, Rupees 250 to 500; Principals of large high schools and of superior training institutions, Rupees 250 to 500. (iii) Assistant Professors of first-grade colleges, Rupees 100 to 250; Headmasters of high and of secondary normal schools, Rupees 100 to 250; Lecturers or assistant masters in second-grade colleges, Rupees 100 to 250; Headmasters of large middle schools, Rupees 100 to 250. (iv) Assistants in high schools and tutorial assistants in first-grade colleges, Rupees 50 to 120; Headmasters of elementary normal schools, Rupees 50 to 120. (v) Headmasters of ordinary middle schools, Rupees 30 to 80; Assistants in large middle schools, Rupees 30 to 80; Headmasters of large primary schools, Rupees 30 to 80. (vi) Assistants in elementary normal and upper primary schools, Rupees 20 to 40; Headmasters of lower primary schools, Rupees 20 to 40. (vii) Assistants in lower primary schools, Rupees 10 to 20. But, with the sanction of Government, as regards the collegiate grade and with the sanction of the Director as regards the other grades a higher salary may be given than that entered in the above scale. The holders of certificates of the general education test are entitled for a limited period to grants of one-fifth of the total salary received within the above limits; the holders of ordinary certificates, i.e., certificates of having passed in method and teaching and of having been employed for two years as teachers, to grants of one-fourth of total salary; and holders of normal certificates to grants of one-third of total salary. For female teachers the rates are more liberal. The grants are ordinarily calculated on the following scale of salaries:—(i) Lady Principals of colleges, of superior normal and of high schools, Rupees 250 to 500. (ii) Assistant mistresses in colleges and high schools, Rupees 200 to 400; Headmistresses of high schools who have been brought out from Europe or America, Rupees 200 to 400. (iii) Headmistresses of elementary normal schools and of secondary schools, Rupees 80 to 200. (iv) Headmistresses of upper primary schools, Rupees 20 to 80; Assistant mistresses in lower secondary schools, Rupees 20 to 80. (v) Headmistresses of lower primary schools, Rupees 10 to 40; Assistant mistresses in primary schools, Rupees 10 to 40. In assigning grants the nature of the work to be performed by the teacher is to be taken into account. In the case of poor schools and schools for Mahomedans and of science, art and industrial schools and in schools in backward localities or for indigent or less advanced classes special relaxations of the above rates are permissible. Provision is also made for specially qualified teachers of music, singing and drawing and of Oriental or other languages and industrial teachers, superior and elementary, to gymnastic teachers, teachers of Kindergarten, and drill instructors, and to matrons, superintendents and assistant superintendents of boarding schools.

778. The results system, which is the system under which the general elementary education of the people is mainly being developed, is briefly as follows. The manager of the school, who is ordinarily the master, has to apply for the examination of certain pupils under certain standards, within a specified date, to the President of the Local Board in which the school is situated if the grant be payable from Local funds or to the Inspector if the grant be payable from Provincial funds. The President or the Inspector refers the application to the Deputy Inspector, who sends it after inquiry to the Inspector, who furnishes a list of all applications received to the President or the Inspector with his recommendation.

In the case of schools aided from Local funds the President finally settles what schools are to be examined, and the standards under which pupils may be examined. Such portions of the lists as relate to the standards, aided from Provincial funds, are forwarded by the President to the Director of Public Instruction for decision, with his recommendation. The lists, when sanctioned, are published in the Fort St. George or District Gazettes together with the date fixed for the examination of each school. In selecting schools and fixing standards eligible the funds available the financial needs of each school, the number and character of the existing schools and the educational wants of the neighbourhood and of the circle or Municipality itself are to be taken into consideration. An appeal lies to Government against any order refusing to admit a school for examination. The conditions of aid are briefly these. The school must not contain classes above the upper fourth of a Government school. Except in Municipalities, no school shall be eligible for admission to the annual list which has not, if a school for boys, an average daily attendance during the three months preceding the date of application of ten pupils, if a school for girls, of five girls. In schools in Municipalities the average attendance must not be less than twenty and ten respectively, except in schools for Mahomedan girls when an average attendance of five may be accepted. Preference is to be given to schools which are properly organized and provided with a fairly sufficient and efficient teaching staff, which have suitable accommodation, furniture and apparatus, comply with the provisions of the school fee notification and are continuously maintained; the prescribed returns and statements must be furnished; registers of admissions, attendance, and fee collections must be kept. The subjects of examination under the several standards are periodically notified. To be eligible for examination a pupil must have attended the school for not less than three hours a day for at least 90 days, or on the Neilgherries 75 during the 180 successive school-days preceding the examination; to be examined for a standard the pupil must have been studying for the standard throughout the 180 or, in the case of night schools, 120 successive school-days preceding the examination. Grants are of two classes—merit and ordinary. Pupils passing the Middle School examination in the first class are eligible for a merit grant, and those passing in the second class for an ordinary grant of the seventh standard; to be entitled to a merit grant in the other standards a pupil must obtain three-fourths of the maximum marks in optional subjects and one-half in compulsory subjects; to be entitled to an ordinary grant in the compulsory subjects a pupil must obtain one-fourth of the marks in arithmetic and one-third in the remaining subjects and on the whole as regards fifth and sixth standards, and one-third in each subject as regards the lower standards; ordinary grants in optional subjects are given if one-third of the maximum marks be obtained in the case of fifth and sixth standards and if two-fifths be obtained in the case of lower standards; the grant may be withheld for falsification, irregularity, &c.; immediately after the conclusion of the examination the examining officer must grant to the manager a memorandum in cheque form certifying the amount of grant earned and the particulars; the memorandum, when endorsed by the manager, may, if the grant is payable from Local funds, be cashed at the nearest treasury, or if from Provincial funds similarly after being countersigned by the Inspector of the division. The table at foot [25] shows the grants claimable under the several standards. Grants earned by male pupils under the third, second, and first standards in non-municipal towns and rural circles, the agency tracts of

teacher, and secondly by the results grants in addition earned by the school or a certain portion thereof. It is adopted in some Municipal and Local Fund schools proper, as well as in certain schools aided by these bodies. The new code recently introduced provides for schools being aided on the combined system. In regard to Local Fund and Municipal schools proper, i.e., schools maintained by Local Fund Boards and Municipalities, in which they retain the fees and are responsible for all charges, the system merely implies that the Boards remunerate their teachers partly by fixed stipends and partly according to the results obtained by them in the course of a year's teaching. In some places a very small fixed stipend is given and three-fourths of the total grant earned; in others a larger fixed stipend and only one-fourth of the results grant earned. Arrangements are made in larger schools worked on this system, by which the head teacher receives a small percentage of the grant earned by the teachers of the several classes. In schools of a quasi-private character aided by Local Boards or Municipalities on this system, the head teacher or sole teacher is regarded as the manager. He is allowed to retain the fees, and must supply all apparatus, books, &c. He receives a fixed monthly stipend, which is ordinarily rather less than one-twelfth of the maximum grant he would be likely to earn for one year's work. If the results grant exceeds the total of monthly stipends in one year, the balance is paid to him; if it is less he is liable to have the deficiency deducted from the following year's earnings and his fixed stipend reduced. Here, too, the practice differs greatly in different districts.

780. In addition to the grants claimable under the above systems in elementary schools, these schools, if of a permanent character, are entitled, under whatever system conducted, to building grants, to grants for furniture, maps, apparatus, diagrams, &c.; and in poor schools to grants for school-books to be used only in the school. In normal schools, grants are given for scholarships and in European schools for feeding and clothing. The Grant-in-aid Code also provides special encouragement for art and science, for gymnasia, for ordinary scholarships, for industrial schools, for school buildings, for libraries both school and public, and for the endowment of schools.

781. The salary-grant system demands responsible and trustworthy management. The results system is best suited to such elementary indigenous schools, as are gradually passing into the class of schools permanently "under inspection;" and also to large mission and poor schools in which the managers are unable to levy fees regularly, or to secure regular attendance, or to supply certificated or trained teachers; and to institutions in which the managers desire as little State interference as possible. The combined system, though at present tending to be more expensive than the results system proper, is the best system which has been devised to meet the case of the improved pyall schools in the rural tracts; this system induces teachers of such schools to qualify themselves for the elementary teachers' test, and gives the village teacher an authoritative position in his village.

782. DESCRIPTION OF INDIGENOUS INSTITUTIONS NOT FALLING UNDER ANY OF THE CLASSES, ABOVE MENTIONED.—The high priests called Tumboorauns of the matts or religious colleges attached to temples generally give lectures or depute their former pupils to do so in the various works of Tamul literature. Such occupations are considered a part of their religious duty. The students are generally grown-up young men, intended less for secular than for clerical life. They pay no fee. On the contrary they receive food, and are an integral part of the religious establishment of the temples. The curriculum of such institutions is shown at foot.^[26] The five following special seminaries for Sanscrit learning are to be noted:—The Triplicane Veda Pautashaula, the Triplicane Sanscrit school, the Shadagopa Nilayam at Conjeeveram, Patoheappah's Sanscrit school at Chidam-

[²⁶] CURRICULUM OF A HINDOO COLLEGE.—In the high class indigenous institutions the curriculum contains briefly the following studies in Sanscrit:—the Vedas, Oupanishads, the Indian system of logic and various systems of philosophy, the grammar of Panini, rhetoric, the Ramayanam, and other epic poems, the dramas of Calidasa and other Hindoo dramatists, besides the Hindoo law treating of affairs both temporal and spiritual, and the minor literature that now enters the University curriculum; in Tamul the classical works, both literary and ethical, of the Madura Sungam or college, grammar, and the system of the Shoiva religion.

baram and the Sanscrit college, Trivandy. In the case of villages also away from the seats of such institutions, there are to be found numerous pundits who regard it as a meritorious act to impart to the young the learning they have acquired. The only payment that students tender to these is the "Gooroo Daeshana" or presents graduated according to their means and given chiefly in kind; but the students not unfrequently render personal service to the pundits. The civil indigenous education of the population is found in the pyall school, a most ancient institution. This is so called from the fact of its being held generally in pyalls or low verandahs. The teacher's emoluments consist in small fees paid by well-to-do parents, in presents paid by all parents at the time of important local festivals such as the Dusserah, Sanceranty, &c., and occasional presents in cash or kind made by villagers when a youth begins the study of a new book or when the school closes for local holidays. In schools containing a considerable number of boys the teacher employs one or more of the older boys as monitors and assistant teachers. In Mussalman schools of this class no monthly fee is charged and the teacher is entirely dependent on presents. The father of each child sends with him as large an entrance donation as his circumstances permit. Whenever a new chapter of the Koran is commenced the pupils give from four annas to four rupees according to the means of the family, and at the commencement of every principal festival such as Moharram, Shab-i-baraut, Ramzan and Buckreed, presents varying from one fanam to four annas are given to the teacher. When the Koran is finished the teacher receives as handsome a reward as the circumstances of the parents will allow. These schools are gradually adopting the character of results schools. The foot-note [27] shows the curriculum of the ordinary Hindoo pyall school, and the next [28] the curriculum of a Madrissa. The table in the next note [29] shows the distribution in April 1881 of indigenous schools not brought under the supervision of the department.

783. DESCRIPTION OF VARIOUS SPECIAL INSTITUTIONS, &c.—The University of Madras is constituted on the model of the University of London, in all respects except that it provides for the affiliation to itself of colleges and is purely an

[27] CURRICULUM OF A HINDOO ELEMENTARY SCHOOL.—Five subjects are always taught in a pyall school, whatever its character. These are reading, grammar, writing, arithmetic, and memoriter exercise in the high dialect and Sanscrit. All the text-books are in the high dialect, and ordinary modern Tamil, &c., is not taught at all. The books used in almost every Tamil school are:—The Cooral of Tiruvalluvar, Auttisoody of Auveiyur, Krishnan-toothoo, Panchatantra, Ramayanam of Cumban, Katachintannany, the grammatical portion of study is drawn from the Nunnool and the Nigantoo. In Telooگوو schools the list is different and includes Sabhaparvaim, Saptamascandam, Soomati Shatacam, Nalopakyasnam. There is no grammatical instruction in Telooگوو schools corresponding to that from the Nunnool in Tamil schools, but the Telooگوو Amaram takes the place of the Tamil Nigantoo. Some of the books in both lists have been printed. If the price is small, printed editions are used; otherwise the teacher alone has the book itself, and from that he daily copies on cadjan the portion required for the next day's work. Writing is taught in conjunction with the reading lesson. The pupil begins his writing lessons when he commences to learn his alphabet. He does not make strokes, pot-hooks, and hangers. His first lesson is a complete letter. The alphabet is almost everywhere written with the finger on the sanded ground. When the pupil becomes tolerably dexterous in doing this, he may then write either with an iron style on cadjan leaves, or with a reed on paper, and sometimes on the leaves of the *Aristolochia Indica*; or again with a kind of pencil on the palaca, or haligoy which answer the purpose of slates. The two latter are the most common in Telooگوو districts. The palaca or haligey is an oblong board, about a foot in width and three feet in length. This board when planed smooth has only to be smeared with a little rice and pulverized charcoal, and it is then fit for use. The other is made of cloth, first stiffened with rice-water, and then covered with a composition of charcoal and several gums. It is then doubled into folds resembling a book. The writing on either of these may be effaced by a wet cloth. Each school-day, after 2 o'clock, the pupil copies the next day's lesson from the teacher's cadjan on to the palaca or portable black-board, which the parent must provide for his son, and which has to be blackened by the pupil as often as that is required, usually three or four times a day. The pencil used is made of soft gypsum, or balapam as it is called in the vernacular. Having copied his lesson, the pupil carries it to his master, who hears him read it two or three times, making the necessary corrections both in writing and verbal delivery. The palaca is then carried home, its contents are learnt by heart, and next morning the lesson is repeated from memory to the teacher. This exercise is a very profitable one, as it teaches how to write and read, improves the memory, and stores it with the best literature of past ages. To deliver the lesson, the boys go one at a time to the teacher, holding the palaca before them with its front to the teacher and its back to themselves. In this way every pupil obtains a thorough knowledge of four or five of the great classics of the language and becomes perfectly able to read his vernacular. It is not certain that any other system would produce better results. In one respect the system is better than that adopted in European schools for the poor. The classic books thus mastered are also the moral law of the nation, and exhibit a system of the ethics of the highest character. The Cooral forms the real moral code of the country, and there can be no doubt as to the benefit that must follow such moral training. In addition to the regular teaching thus referred to, it is common here for the teacher to borrow manuscript letters from his friends. These are carried to the school, read, copied, studied, and explained. The vernacular current hand is wholly different from the printed character. The native system of arithmetic is explained in Vol. II, App. XXXV. Beyond the subjects above noted, nothing is taught but matters connected with religious ceremonial; the calendar festivals, lucky and unlucky days, &c.

[28] CURRICULUM OF A MAHOMEDAN MADRISSA.—The course of study in Mahomedan indigenous schools consists almost exclusively of instruction in religious works. First, the pupil is taught the rudiments of the Arabic language, and he then immediately begins the Koran. When this is finished he receives instructions in Hindostany in such books as Sirathul Islam, Stratham Naiyat, Zanajeer, &c., all of which treat of religion. Persian is taught in advanced schools. No instruction is given in history, geography or arithmetic.

examining body, conferring degrees in Arts, Law, Medicine, and Civil Engineering. The Senate, which consists of a Chancellor, a Vice-Chancellor, and not less than thirty Fellows, is divided into the four Faculties just mentioned, and has power, subject to the approval of Government, to make bye-laws and regulations. The executive government of the University is vested in the Syndicate. This body appoints Examiners, regulates examinations, keeps the accounts, and carries on the correspondence of the University, with the aid of the Registrar, who is an officer appointed once in two years by the Senate. There is no limit of age for any of the University examinations. In the Faculty of Arts there are four examinations: the Matriculation, First Arts, B.A., and M.A. Examinations. In the Faculty of Laws examinations are held for the degrees of Bachelor of Laws and Master of Laws. The Faculty of Medicine has the degrees of Licentiate in Medicine and Surgery, Bachelor of Medicine, and Master in Surgery. Candidates who have obtained the degrees of B.A. and M.B. and C.M. are permitted to proceed to the degree of M.D. without examination on producing a certificate of having been engaged two years in the practice of their profession. Previous to the institution of the University, medical diplomas were conferred by the Medical College. The only examination in the Faculty of Civil Engineering is that for the degree of Bachelor of Civil Engineering. The table given below ^[30] shows the number of degrees conferred since the establishment of the University down to the end of 1884. Fees ranging from Rupees 10 to Rupees 50 are levied for various examinations of the University; and these cover the whole cost of the University and leave a surplus, the balance in favor of the University fund on the 1st April last amounted to Rupees 23,226-8-1. The tabular statements at foot ^[31, 32, 33] afford information in regard to the results of the Matriculation, F.A. and B.A. examinations. During the decade ending in 1880-81, 17 Bachelors of Arts obtained the degree of Master of Arts, 12 in Mental Philosophy and Sociology, 3 in English and Sanscrit, 1 in English

and Latin, and 1 in Biology. The results tabulated show that the higher education of the natives of the country has been advancing under the influence of the University. The great disparity in the numbers passing the Matriculation, F.A., and B.A. examinations suggests the inference that a large number of students enter for the Matriculation examination who have no intention of prosecuting their studies even up to the F.A. standard.

784. Female education was for many years, as will have been observed from the sketch history, almost entirely in the hands of the various missionary societies. Of late years secular schools have been springing up in various parts of the Presidency, among which may be specially named several large schools established by the Maharajah of Vizianagram at Madras and in various parts of the Northern Circars. The Maharajah's schools at Madras are now under the

management of the Madras Branch of the National Indian Association and they receive aid from the State, and the rest though unaided are under inspection, and furnish returns. About fifteen years ago a Government Normal school was established at Madras for the education of teachers for native girls' schools, but it became in great measure a high school for East Indians and Europeans, and during its existence educated only 60 Hindoo and Native Christian teachers. It has been re-organized since and is now fulfilling the object with which it was originally started. Some five or six years ago the Government undertook the charge of a few elementary schools for girls, which had been established by some Local Fund Boards and Municipalities and during the past two or three years the number has been considerably increased, care being taken not to interfere with private effort. There were 35 such schools at the close of 1884-85, one in the hill tracts of the Godavery district, six in Nellore, three in South Arcot, four in North Arcot, four in Salem, four in Tanjore, five in Ganjam, two in Vizagapatam, one in Anantapore, three in Coimbatore, and two in Malabar. With one or two exceptions, they are all doing fair work and are gradually improving in standard, thirteen schools having already begun to give secondary education. Several of these schools are situated in towns of importance. In addition to the girls' schools maintained by Government, there were in 1884-85 fifteen girls' schools maintained by Municipalities and thirty by Local Fund Boards. The Municipal schools are in the towns of Adony, Caroor, Erode, Mayavaram, Nellore, Salem and Shreerungam, and the Local Fund schools in the districts of Bellary, Ganjam, Godavery, Salem, and South Arcot. The Government have also liberally aided private enterprise. There are also few large towns in the Presidency in which a mission society does not continue to offer facilities for female education, and in many cases of late more especially for the education of the girls of the higher castes. In Tinnevely in particular, in pursuance of the policy inaugurated by Mr. Lash of the Church Missionary Society, who developed the Sarah Tucker Female Training School into an institution mainly for the training of girls of the respectable classes, who would be suitable for teachers in caste schools, between two and three thousand girls are studying in small elementary schools, maintained by the Church Missionary Society in different parts of the district, mostly under the management of a trained mistress assisted by her husband. The Sarah Tucker Institution turned out in 1879-80 as many as 35 schoolmistresses of the second and third grades. Mistresses educated in this institution are in demand throughout the Tamul districts both in mission and secular schools, but it is difficult to induce them to take service far from their homes except at comparatively speaking high salaries. To supply the demand for female teachers in the central Tamul districts, a training school has been opened at Trichinopoly under the auspices of the Society for the Propagation of the Gospel. There is a normal class attached to the Free Church Female Christian Institution, Madras, which produces some five or six teachers annually of the first, second, and third grades; and in the Northern Circars the agents of the Church Missionary Society have established a normal class or school in connection with their boarding institution for girls at Masulipatam. The table at foot [34] shows the distribution of the girls throughout the districts. A small proportion of

these are reading in pyall schools. Most aided girls' schools are aided on the salary-grant system, but results grants are in some cases given at rates 75 per cent. higher than those allowed for boys. Results grants are also given for needlework at rates ranging from 1 rupee to Rupees 4. Twenty-six girls' schools ranked as high schools and one hundred and thirty-nine as middle schools on the 31st March 1885, the rest, including all the Government and quasi-Government schools, are primary. During the ten years 1875-1885, the number of girls receiving instruction rose from 19,582 to 50,919 as seen in the statement at foot.^[35] The extent of female education in Government, aided and unaided schools in 1884-85 is shown in the next statement.^[36] To obtain the exact number of girls at school there must be added to the total of 32,299 girls on the rolls of actual girls' schools, 19,462 girls who were in boys' and private schools, while 842 must be deducted on account of the number of boys of tender age in girls' schools. This gives 50,919 as the exact number of girls at school on the 31st March 1885.

785. For Mahomedan education there are in all 13 Government combined schools in Madras, 3 Mahomedan departments attached to the Government High Schools at Chittore, Cuddapah, and Kurnool, and 9 Municipal schools for the special education of Mahomedans. All the Government schools are primary schools with the exception of the Madrissa-i-Auzam, which was raised recently to the status of a high school in consequence of the abolition of the junior department of the Presidency College. Salem has a Municipal Anglo-Vernacular primary school and Bellary 5 Municipal Hindostany schools. The towns of Cochin, Combaconam and Tanjore have each a Municipal Hindostany school. Of aided schools, with a special provision for Mahomedan pupils, may be mentioned the Harris' school, intended solely for Mahomedans, the mission schools at Ellore, Masulipatam and Trichinopoly, and 210 vernacular schools with 6,353 pupils aided on the results system in Malabar. Other educational facilities afforded to Mahomedans are the following:—(a) Arabic and Persian have been recognized as classical languages for the Matriculation and Arts examinations from the establishment of the University, each with a maximum of marks about one-fifth as large again as that allotted to a vernacular language. (b) Mahomedan pupils pay only half fees. (c) Originally three scholarships were provided for the special encouragement of Mahomedans, one being awarded on the results of the F.A. examination and two on the results of the Matriculation. In 1879, four additional scholarships were sanctioned on the results of the Matriculation examination, and this system, under which seven scholarships are annually awarded, still continues. (d) There is a Special Deputy Inspector of Mahomedan schools and a Special Inspecting Schoolmaster for the town of Madras. (e) There is an elementary normal school in Madras for Mahomedans. (f) The results grants allowable to Mahomedan pupils are 25 per cent. greater than the rates for Hindoo pupils.

786. The Madras Medical College, the School of Agriculture, and the Civil Engineering College have already been noticed in this chapter. The Madras School of Industrial Arts has been noticed in Chapter VII. The Lawrence Asylum will be noticed in Chapter IX under the head of Charities. The only other institution of a special nature is the Law Class of the Presidency College. This branch of the college was re-organized in 1884 and there are now two professors. The majority of the students are persons who are following various avocations other than that of law.

787. A Government examination is held in December of each year to test male and female candidates in the principles of method and school management for normal and ordinary certificates as defined in the Grant-in-aid Code. Each candidate has to pay a fee of one rupee and the examination is self-supporting. Under the new Grant-in-aid Code recently framed by Government the examination will be held twice a year from 1886. The standard of the examination is given below.^[37] This examination is not obligatory on teachers of lower primary grade.

788. Two different systems have been tried in the normal schools of this Presidency. Originally the normal school students were kept under instruction for long periods and were prepared for successive Certificate and University examinations. On admission they were required to execute an agreement binding themselves to serve as teachers in a Government or aided school for five years, and during the whole period of their training they were supported by a scholarship, which they were bound to refund in the event of their failing to fulfil the agreement into which they had entered. Under this system the attention of both masters and pupils was too much directed to success in the examinations, and the training

[37] NATURE OF THE TESTS IN SCHOOL MANAGEMENT.—(1) *First, Second, and Third-grade Schoolmasters and First-grade Schoolmistresses.* "a" To answer questions on the best methods of teaching English and Vernacular reading, spelling, grammar, composition, translation, writing, arithmetic, geography, and history in a high school. "b" To answer questions in the art of oral teaching generally. "c" To answer questions on the form of school registers, the mode of keeping them, making returns from them and regarding the correct forms of official correspondence. "d" To write notes of a lesson on a given subject. "e" To answer questions on the organization of a high school. "f" To answer questions connected with moral discipline, as affecting the character and conduct of the pupils of a high school. (2) *Fourth-grade Schoolmasters and Second-grade Schoolmistresses.* "a" To answer questions on the best methods of teaching, reading, spelling, grammar, writing, arithmetic, geography, and history in a middle school. "b" To answer questions on the art of oral teaching generally. "c" To answer questions on the form of school registers, the mode of keeping them and making returns from them. "d" To write notes of a lesson on a given subject. "e" To answer questions on the organization of a middle school.

became a secondary consideration. Those who accepted the scholarships and signed the agreements not unfrequently did so without any real intention of becoming teachers, their object being to pass the University examinations and to obtain employment in the Revenue or Judicial departments. This system has been abandoned. No preparation for University examinations is given now in any of the normal schools. In the Madras Government Normal school students who have already passed such examinations are trained for nine or ten months. It trains in this way those who are already graduates, First Arts men, and matriculates; these receiving scholarships of Rupees 15, 12½, and 10, respectively, with some variant rates. The normal students of this institution come as a rule from the high and middle class schools where they have been employed or have been appointed as masters, and return to those schools after their course of training. On the 31st March 1885, this school contained seven graduates, eight F.A.'s and twenty-five matriculates. Besides these seven military students were receiving instruction. Of the total forty-seven, thirty-three were by caste Brahmins, six were Shoodras, three were Native Christians, and five were Mahomedans. Thirty-seven teachers left the institution during that year on the completion of their training. The Government have raised the annual grant for scholarships from Rupees 4,320 to Rupees 6,000 with effect from 1st April 1885, so as to allow of the admission of from 40 to 45 students. The Government Female Normal school at Madras trains mistresses of all grades. Of the thirty scholarships allowed in the school, sixteen are reserved for caste Hindoos, eight for Native Christians and six for Europeans and Eurasians. Europeans and Eurasians are admitted for one year's training only, while the other normal pupils prepare for examinations while under training. Native students receive stipends ranging from Rupees 6 to Rupees 12, and in the case of pupils whose parents or guardians do not reside in Madras or in its neighbourhood, an extra allowance of from Rupees 4 to 6 is also given. Six girls of any class are admitted as free scholars. The remainder of the Government normal schools, and indeed of all the normal schools in the Presidency, are for the training of teachers for primary schools. Four elementary normal schools are maintained by Government in the mofussil; at Narsapore, Russellecondah, Tellicherry and Vizagapatam. A normal class for training teachers for hill schools is attached to the Government Middle school at Goonapore, in the Vizagapatam district, and a similar class has been opened in connection with the Bhadrachellam Middle school to train teachers for primary schools in the Upper Godavery district. An elementary normal school has recently been established in Madras to train teachers for the Mahomedan schools. In the foot-note [38] are given the rules for

[38] RULES OF ADMISSION TO GOVERNMENT ELEMENTARY NORMAL SCHOOLS.—The following rules have been prescribed for admission to these schools:—(1) In the selection of candidates for admission into elementary normal schools the preference should be given to men of the following classes:—“a” Those who are actually engaged in teaching a pyall school as a means of livelihood and whose regular profession it is. “b” The relatives of pyall schoolmasters, sent by them to be trained, and then to return to their schools as assistants. “c” Men formerly employed as pyall schoolmasters and desirous of returning to that profession. “d” Men desirous of becoming pyall schoolmasters. “e” Men already employed in Local Fund and Municipal schools and sent by the Local Fund Boards and Municipalities to be trained. “f” Men sent by the Local Fund Boards and Municipalities with provisional appointments to posts, the nature and value of which should be stated. “g” Young men from the hill schools of the Ganjam district and from the schools of the Bhadrachellam and Rekapully talooks selected and sent to be trained for posts in these schools. (2) Ordinarily students should be between eighteen and thirty years of age. (3) An entrance examination of candidates for admission shall be held in November or December and a notice of the examination shall be published by the Inspector of Schools in the District Gazette two months prior to the examination. The examination shall be partly viva voce and partly in writing. The precise standard of the examination may vary in different localities and will therefore be fixed by the Inspector of the division, but ordinarily it should not fall below the Lower Primary School examination. If possible the Inspector should arrange his tours so as to be present one year at the entrance examination of the elementary normal school in one district, and another year at that of another, so as to take them all in turn. (4) The candidates must be persons of good character, free from serious bodily defect, deformity, in good health, and vaccinated. (5) The scholarships will ordinarily range in value from Rupees 3 to Rupees 5, and will be fixed by the Director of Public Instruction on the recommendation of the Inspector. (6) Ordinarily they will be tenable for twelve months, but candidates who have failed in their examination may, if recommended by the Inspector, be allowed a second year. If there are no such men, a few of those who have passed may be allowed to hold their scholarships for a further period of three months, so as to teach the practising branch until a sufficient number of the students of the new batch are ready to take their places. (7) Normal students will be admitted in January, but they all be considered on probation for one month, and if the headmaster reports that any of them is not likely to prove an efficient schoolmaster, his scholarship will cease. (8) Every normal student shall be required on admission to sign an agreement binding himself to remain under training during the prescribed period, to take up his appointment at the end of his training, and to remain in it for five years, or to open a school and place it under instruction for the same period, and to refund his scholarship in the event of his failing to fulfil these conditions or of his being dismissed for misconduct or inefficiency. If the normal student is a minor, his parent or guardian must execute the agreement. Students sent by Native States for training in elementary normal schools may be admitted on payment of an annual fee of Rupees 50. They are not entitled to receive scholarships from this Government or the Municipal or Local Boards under its control.

admission to the Government elementary normal schools, and the course of study pursued will be found in Vol. II, Appendix XCVI. The course extends over two terms of six months each. The curriculum followed in these schools is that laid down for the Special Upper Primary Examination:—Vernacular language, Arithmetic, Geography, and any two of the following alternative subjects—History, Hygiene, Agriculture and Needle-work. The Inspectors or Deputy Inspectors examine the students in teaching power, and normal certificates are issued on favorable report. There were 32 Local Fund, 1 Municipal (Madras), 5 aided and 2 unaided normal schools for masters, and 1 Local Fund, 6 aided and 2 unaided normal schools for mistresses at work at the close of 1884-85. There were on the whole 1,155 male and 363 female normal pupils under training in the different normal schools. It has been estimated that two-thirds of the teachers who now hold teachers' certificates have been trained in normal schools. About 600 trained teachers issue from these institutions annually.

769. There are at present five kinds of Government stipendiary scholarships, that is to say (1) scholarships awarded on the result of the University examinations; (2) scholarships given to Oorayah pupils in the talook schools of the Ganjam district; (3) scholarships held by normal students; and (4) scholarships tenable in the Civil Engineering College, the School of Arts, and the School of Agriculture. No scholarships have as yet been instituted in primary schools for boys, whether Government, Local Fund, Municipal, or private, connected with this department, but the Government have recently sanctioned a scheme for the award of scholarships in Government girls' schools, by which a girl on passing the Lower Primary examination (or Third Results standard) receives a stipend of 1 rupee per mensem, on passing the Upper Primary examination (or Fourth Results standard) Rupees 2 per mensem, on passing Special Upper Primary examination (or Fifth Results standard) Rupees 3 per mensem. The scholarships are tenable for one year, conditional on good conduct. The scholar may continue her studies in any other school, Government, Local Fund, Municipal, Aided, or under inspection. The scholarships obtainable in a school may not exceed 3 for the Lower Primary, 2 for the Upper Primary, and 1 for the Special Upper Primary, respectively; or 10 per cent. of the total attendance in the school. Some Local Fund Boards and Municipalities have followed the action of Government. The extract at foot [39] from standing orders for Government schools will show the details

[39] SCHEME OF GOVERNMENT SCHOLARSHIPS AND FREE SCHOLARS.—(1) *Government Scholarships*.—A certain number of Government scholarships are awarded annually on the result of the Matriculation and F. A. examinations; the substance of the rules regarding these scholarships is as follows:—I. No stipendiary scholarships are given to districts in which there are colleges educating up to the B. A. degree. II. In each district in which there is an institution educating up to the F. A. standard, one scholarship of Rupees 15 is awarded under the following conditions:—(a) The candidate must have been a pupil at the time of examination and for one year previous in some institution in the district. (b) At the time of the examination his age must not have exceeded twenty years. (c) He must not be in receipt of any other scholarship. (d) He must engage to prosecute his studies up to the B. A. degree in some college connected with the Madras Educational Department, in which satisfactory provision is made for educating students up to the B. A. standard. (e) The scholarship is tenable for two years, but is liable to be forfeited for idleness or misconduct. (f) In the event of there being several eligible candidates from the same district, the scholarship will be awarded to the candidate who stands highest in the list. III. In addition to the above scholarships, one scholarship of Rupees 15 is awarded to any Mahomedan, and one of Rupees 15 to any Oorayah, who has passed the First Arts examination, without any limitation with regard to age or district, but subject in other respects to the same conditions as the other scholarships. IV. In each district in which the highest grade of school is one educating up to the Matriculation standard, one scholarship of Rupees 10 is awarded under the following conditions. In the Kurnool district six scholarships are awarded under the same conditions. (a) The candidate must have been a pupil at the time of the examination, and for one year previous in some institution in the district. (b) At the time of the examination his age must not have exceeded eighteen years. (c) He must not be in receipt of any other scholarship. (d) He must engage to prosecute his studies for the F. A. examination in some college or school connected with the Madras Educational Department, in which satisfactory provision is made for educating students up to the F. A. standard. (e) In the event of his failing to pass the F. A. examination at the end of two years, the scholarship will be forfeited. (f) In the event of his obtaining a place in the second class at the F. A. examination, the scholarship will not be increased but will be tenable for two years longer, during which the scholarship-holder must prosecute his studies for the B. A. degree in some college connected with the Madras Educational Department, in which satisfactory provision is made for educating students up to the B. A. degree. (g) In the event of his obtaining a place in the first class at the F. A. examination, the scholarship will be raised from Rupees 10 to Rupees 15, and will be similarly tenable for a further period of two years. (h) The scholarship will be liable to be forfeited at any time for idleness or misconduct. (i) In the event of there being several eligible candidates from the same district, the scholarship will be awarded to the candidate who stands highest in the list. V. In addition to the above scholarships, six scholarships of Rupees 10 are awarded to any six Mahomedans, who have passed the Matriculation examination from any institution connected with the Madras Educational Department, without any limitation with regard to age or district, but subject in other respects to the same conditions as the other scholarships. VI. In case of the death of a scholar, the scholarship will be awarded to the next F. A. student or Matriculate in the examination list, provided he fulfils the conditions generally, and in the matter of age was within the limit at the time of the examination. One Government scholarship of Rupees 6 is attached to each of the Oorayah middle schools in the Ganjam district, and to the Goompore school in the Vinaguputam district, and is awarded to the best Oorayah pupils of these schools. The scholarship-holders are required to proceed to the high school of Berhanipore and

for the scheme of scholarships and free scholars in force in Madras. Chapter VII of the new Grant-in-aid Code provides a scheme of scholarships, and in future it is intended to promote the education of talented, but poor pupils, and the advance of higher education among backward classes, and in backward tracts by this means alone, abolishing at the same time most of the stipendiary scholarships now given for general education.

790. CONSTITUTION OF GOVERNMENT DEPARTMENT.—The Government Department of Instruction is administered by a Director, assisted by seven Inspectors, who are graded officers, and an Inspectress of Girls' Schools. The charges of the several Inspectors are shown at foot.^[40] The Inspectress of Girls' Schools has charge of all girls' schools in the third, fourth and fifth divisions and in the districts of Coimbatore and Trichinopoly. The vernacular of the first division is chiefly Teloo goo; of the second, chiefly Teloo goo also; of the third, about equally divided between Teloo goo and Tamul; of the fourth, chiefly Tamul; of the fifth, Tamul; of the sixth, Tamul and Malayalam; and of the seventh Canarese. These seven Inspectors and the Inspectress of Girls' Schools are assisted by the staff of Deputy

to prosecute their studies up to the Matriculation standard. The scholarships are tenable for four years subject to the holders passing the Middle School and Comparative examinations. (2) *Endowed Scholarships*.—Besides these Government scholarships, there are ten endowed scholarships in connection with certain Government schools. (3) *Free Scholars*.—The number of free scholars in Government schools is limited to five per cent., and in aided institutions to fifteen per cent. in the college, ten per cent. in the high, and five per cent. in the middle and primary departments exclusive of students upon endowments. The only free scholarships given in Government schools are those coming under the following heads:—I. The Principal of a first-grade college and the headmasters of schools under the control of the Inspector, with the sanction of that officer, may admit, as free scholars or as scholars paying fees at favorable rates, to the college or high school department, a pupil who has acquitted himself very satisfactorily in the F.A. examination, the Matriculation examination, the Middle School examination, either of the Comparative examinations, or the Upper Primary examination, provided the pupil—(a) makes his application immediately after the results of the examinations concerned are known; (b) has not joined another institution in the term in which the application is made, or, if he has joined, makes his application with the approval of the headmaster of that institution; (c) was in attendance at a recognized institution during the whole of the two terms of the school year to which the examination concerned was the termination, and has paid his fees for these terms; (d) is certified to have conducted himself well during the preceding year; (e) is certified not to be in a position to pay the whole or part of the prescribed fee; (f) is not of an unsuitable age for the class in which he will be placed. II. The percentage of such scholars does not exceed five in any department without the express sanction of the Director. In all cases the admission of a free scholar must be noted in the monthly return, with a brief statement of claim to such concession. III. The grant of a scholarship must be limited to one year, but may be extended, if the holder has given satisfaction, and has secured promotion to a higher class at the end of the year. IV. A scholarship will be forfeited by misconduct, idleness or irregularity in attendance. V. In the selection of free scholars, the claims of applicants belonging to indigent, backward or socially inferior classes are specially considered; also the educational condition and means of the town or village to which the applicant belongs. VI. A free scholarship, tenable for two years in a Government college selected by the Director, will be awarded by him, on the recommendation of the Inspector of Schools of the division, or the Principal of a Government college to any master holding a permanent post in the Government service, who having passed the F.A. examination desires to study for the degree of Bachelor of Arts. The free scholar must study the optional subject recommended by the Inspector or Principal and approved by the Director. During the tenure of the scholarship, leave of absence from his appointment will be granted on forfeiture of full pay. The scholarship will be withdrawn for misconduct or neglect of duty.

Inspectors shown below.^[41] There is also a Deputy Inspector of Mahomedan schools, who travels in the second and third divisions inspecting middle and elementary Mahomedan schools. These Deputy Inspectors are divided into seven classes as shown below.^[42] Each deputy is provided with a clerk. To facilitate inspection work additional Deputy Inspectors were once provided by certain Local Boards from Local funds as shown below.^[43] Their salaries varied from Rupees 60 to Rupees 80. But all these deputies have since been brought on the Provincial list. As there are 157 talooks in the Presidency, the average number of talooks in charge of an officer of this grade is a little more than two and the ranges are equally distributed among them with a few exceptions. The Deputy Inspectors are assisted in the charge of elementary schools by a class of subordinates denomi-

nated Inspecting Schoolmasters. The table below [*] shows their distribution in 1884-85. There are, besides, two officers of the same standing, styled Superintendents of Hill Schools, employed in the Ganjam and Vizagapatam agency tracts. Some Municipalities have of late been employing certain teachers to supervise the elementary schools in the towns. There were ten such superintendents at the close of 1884-85.

791. The Inspectors of the department exercise a disciplinary control over all subordinates, that is to say, all educational employés in their divisions, excepting masters in first-grade colleges, in the second-grade colleges at Calicut and Mangalore, and in the Madras Normal school ; whether those subordinates are paid from Provincial or Local funds. With the exception of Provincial servants drawing Rupees 30 and under they possess no patronage ; as regards Provincial servants the appointments resting with the Director, and as regards Local Fund and Municipal servants with the Presidents of the Municipalities or Boards. The practice however is for the Presidents to commit to the Inspector very considerable power regarding the employment and dismissal of their educational servants. The duties of the Inspectors are chiefly confined to the inspection and examination of second-grade colleges, high and middle schools, whether Government, aided, or under inspection in their divisions, of normal schools, and of primary schools attached to colleges, high and middle schools. They also supervise their deputies in the control or inspection of lower-middle and primary schools in their ranges and in the management of the Inspecting Schoolmasters. Lastly they have the general care of all matters connected with education in their divisions, more especially such as come before them in their capacity of advisers of District Boards and Municipal Councils, of which they are usually members. The Deputy Inspectors ordinarily have charge of Government middle and elementary normal schools in their ranges, but their chief duties are connected with the control, examination, or inspection of the primary schools in their ranges, according as the schools are Government, Board or private. They are immediately responsible for the work of the Inspecting Schoolmasters and of the masters of elementary normal schools. The work devolving on Inspecting Schoolmasters is the improvement of the elementary primary schools throughout the country, by visiting and instructing the teachers, and in a measure the scholars of such schools ; also by inducing them to bring these schools under Government inspection and to conform to the rules prescribing the subjects to be taught in such schools and the method of such teaching.

792. The system of inspection in force is as follows. With regard to Government institutions the Inspector of the division accompanied by his deputy, who aids in the vernacular work, examines the primary classes once a year in certain subjects, and reports thereon immediately to the Director. These classes are also tested for promotion annually according to the regulations of Upper and Lower Primary examinations. In the middle schools the classes are inspected at shorter intervals by the Deputy Inspector. The system of inspection of public institutions maintained from Municipal and Local funds is similar to that above stated; but in the case of schools receiving aid from Provincial funds under the results system the pupils presented are carefully examined for grants under the results rules by the inspecting officers. Some of these Local fund and Municipal institutions are practically administered by the department, but others are directly

managed by the Boards. The primary classes in private institutions under superior management, if aided under the salary system, are examined annually by the Inspector aided by his deputy; but the examination is not ordinarily of great length, more especially since a rule made in April 1880 forbidding private schools to promote to the Upper Primary department pupils who have not passed the public Lower Primary examination. In schools aided on the results or combined system, a careful examination under the several standards is carried out in the presence of the managers and others. Although in all schools under inspection an Inspector, or his deputy, may claim entry when he pleases during school-hours for inspection purposes, yet it is usual to give notice some time beforehand of the proposed date of inspection. In the more important private schools, the managers of which are ordinarily the headmasters, and in all such as are aided on the salary system, the inspection is carried out as above noted; but in the smaller schools, especially those in the rural tracts, aided on the combined or results system, the inspection is ordinarily conducted by the Deputy Inspector. This officer should visit such schools at least once in the interval between his annual examinations for results; and the Inspecting Schoolmasters, where their aid is still needed, once a quarter. The present staff of these officials is however at present insufficient in most districts to carry out such a programme in its integrity. Primary departments in schools of the higher class under inspection are inspected once a year, but except in institutions, such as the Vizianagram College, for the management of which the department is in a measure responsible, the inspection is of a very cursory character. In regard to elementary pyall schools the inspections by the Inspecting Schoolmasters are intended to be frequent, in order that the schoolmaster may receive assistance in adapting his teaching to the authorized standards and methods. As regards schools "not under inspection," no formal inspection is made of the larger institutions; but it is the practice to visit such schools should the managers desire it, and aid them by advice. No reports of such visits are recorded. It is the duty of the Deputy Inspector or of his assistant, the Inspecting Schoolmaster, to visit all indigenous schools and other pyall schools, and to endeavour to bring them under inspection by pointing out the advantages to be derived therefrom, and by aiding them in procuring the necessary books, &c., and by instructing the teachers therein. It is by this means that the schools, indigenous and pyall, throughout the country are now rapidly passing under the supervision of the department. The powers of inspecting officers in aided schools are regulated by the Grant-in-Aid Code, which provides as a condition of aid under the salary system that a manager must bind himself "to subject the institution, on behalf of which the application is made, together with its current accounts, list of establishment, time-table, scheme of studies, and register of attendance to the inspection of a Government Inspector, such inspection and examination relating only to the general management and to the secular instruction, and having no reference to any religious instruction which may be imparted;" and it is a condition of aid under the results system that "regular registers of admission, attendance, and fee collections shall be kept and shall be submitted for inspection when demanded."

793. The general education tests and the departmental test in the principles of method and of school management which teachers must pass who desire a complete certificate have been explained above. There were 21,402 teachers employed in 1884-85 in the schools connected with the department. Of these 268 formed the European staff, and 3,272 were holders of normal and ordinary, and 3,480 of general education certificates, while 14,382 men have passed no examination. These teachers are chiefly employed in primary schools and classes, a few being vernacular pundits, employed in superior institutions.

794. Sixteen superior officers of the educational department, including the Inspectors of Schools, the Principals of the Presidency, Combaconam, Rajahmundry and Agricultural Colleges, and the Professors of the Presidency College, are graded in classes, and their salaries rise by annual increments from the minimum to the maximum prescribed for their class. The Principal and Professors of the Medical College, who belong to the Indian Medical Department, and the Principal of the Civil Engineering College, who is an officer of the Corps of Royal Engineers, are subject to special regulations. The principle of giving salaries rising by increments

has been recently sanctioned in the case of the masters employed in all Government institutions, with a few exceptions. Although the Medical College is under the control of the Director of Public Instruction, no charges connected with this institution fall on the educational budget. The salaries of the Principal and major Professors, who are all officers holding various medical appointments, and the stipends of the Military Hospital apprentices appertain to Imperial services. The salaries of the minor Professors and all the other items belong to the medical branch of Provincial services.

795. FINANCIAL.—An Educational Building Fund was originally formed from the surplus balance of the Devastaunam funds. Under the orders of the Court of Directors this amount was set apart for educational buildings and was subsequently considerably augmented by a transfer of the unexpended portion of the annual grant of Rupees 50,000 given for native education from 1828-29 to 1854-55. A 4 per cent. treasury note was issued in the same year for Rupees 10,00,000, afterwards reduced in 1868 to Rupees 8,00,000. The interest upon this note, after meeting charges incurred in connection with educational buildings, was credited to the Educational Building Fund and continued to accumulate until July 1861, when the Secretary of State directed that no further additions should be made by the accumulation of interest, and that, whenever the building charges fell below the interest, the balance should be applied towards defraying general educational expenditure. Sums raised by private contributions and subscriptions for the construction of school-houses were credited to this fund. All charges on account of educational buildings were met from it until 31st March 1884 and divided into charges on account of original buildings and repairs of Government colleges and schools and building grants to aided colleges and schools. These charges of late years greatly exceeded the annual receipts from interest and local contributions, and it was necessary from time to time to divert considerable sums from capital. The Presidency College, the Senate House, and the Combaconam College have largely contributed to the depletion of this fund, which was reduced on the 31st March 1884 to Rupees 2,178-9-1. The fund was wound up at the close of the year, the balance having been credited to Provincial funds, from which all building charges are now met.

796. The undermentioned scale of school fees has been levied since the 1st January 1884 in schools connected with the educational department.^[*] In any town in which a college or school supported solely from Provincial funds exists, having departments corresponding to those of any public college or school in the same town in which fees are levied at the rates fixed above, the fees in the college departments of the Government institution are levied at rates not less than 20 per

cent. in excess of those sanctioned for the locality. In college department of the Presidency and Combaconam Colleges the excess rate is 25 per cent. Managers of aided colleges are permitted to levy the term fee in college departments by four instalments of Rupees 12, Rupees 8, Rupees 5 and Rupees 5, the first instalment being paid on the opening of the college, the second within sixty days from the opening, and the third and fourth at subsequent intervals of thirty days, so that the entire fee may be paid within the first four months of the term. An entrance fee equal to double the fee of the class is charged when a pupil is admitted or readmitted to a primary class. No other entrance fee is levied. The above scale and fees are not however applicable to schools for native girls, for European and Eurasian poor and other indigent classes, to practising schools attached to normal schools, to industrial and other special schools, and to primary schools aided on the results system. Mahomedan and Oriyah pupils pay only half the above rates. Special favorable rates of fees may be sanctioned by Government for backward localities and backward and indigent classes of pupils. No school-fees are levied in the hill schools of Goomsoor and Chinna Kimeddy and some of the other elementary schools maintained by Government for special classes. The rules relating to school-fees have been declared not to be in force in schools aided on the results or combined system, and in schools supported directly by Local Fund and Municipal Boards it is left to the Boards and Commissioners to decide whether any, and if so what, fees shall be levied. In Government institutions maintained from Provincial funds all school-fees are paid into the treasury and credited to Provincial services. School-fees now form an important contribution towards the cost of education. The table below [⁴⁶] shows the receipts from this source in Government, quasi-Government, and private institutions for the ten years ended 31st March 1885. Comparing the fees with the attendance, it will be noticed that during the decade the attendance in Government institutions fell, but the fees rose by 22 per cent.; in schools under the management of District Boards and Municipalities and of committees under the control of Government the attendance rose by 82 and the fees by 343 per cent.; and in private schools the attendance rose by 51 and the fees by 81 per cent. The percentage of increase in the fees of private institutions appears here as comparatively low owing to the inclusion under this head of the numerous results schools charging nominal fees or no fees at all. If schools aided on the salary system alone are taken, these schools being the institutions affected by the Government restrictions in regard to fees, the increase in fees in private schools was over 100 per cent. In the next statement [⁴⁷] are shown, for ten years, the total fee receipts in all institutions, as given in the last column of the last table compared with the total expenditure in the same institutions. The proportion between the two shows the percentage that the fees paid by pupils bear to the whole cost of their education. Owing to the successive additions to the rates of fee, the

proportion that the fee revenue bears to the total cost of education was greater in 1885 than in 1875. The fee receipts in the period rose by about 80 per cent., but the expenditure rose by 55 per cent. only. The next statement [47] deals with fee receipts in non-Government institutions and with grants-in-aid made to these and shows the proportion between what the pupils themselves pay and what is paid by the Government. In 1877-78 Rupees 100 paid in fees was aided by Rupees 121½; in 1878-79 Rupees 100 paid in fees was aided by Rupees 92½; in 1879-80 Rupees 100 paid in fees was aided by Rupees 77½; in 1880-81 Rupees 100 paid in fees was aided by nearly Rupees 69; in 1884-85 Rupees 100 paid in fees was aided by Rupees 72½. The next table [48] shows the average fee in the first and last years of the decade ending 31st March 1884 in the several classes of institutions.

797. The percentage statement [50] given below shows the proportionate amount spent from all sources on the different branches of education as shown by the figures of the latest available year. The next statement [51] shows the total expenditure on Government and private institutions as distributed between public and private funds according to the returns of the same year. The table shows, that is to say, how much is given on the whole by the State, and how much by the public. The fees collected in purely Government institutions and carried to credit in that year was Rupees 1,50,001; the net expenditure was therefore less by this amount than the sum shown below. The figures do not include expenditure on buildings.

798. LAW AND RULES.—There are no Acts in force regulating the working of the department. The City of Madras Municipal Act and the District Boards Acts of 1884 contain, among other subjects, provision for the encouragement of elementary education, whilst the District Municipalities Act provides for the regulation of education in some detail. The middle education of boys in the mofussil municipalities was transferred to these bodies from 1st April 1883 on the recommendation of the Local Self-Government Committee. The Grant-in-Aid Code contains rules regarding the nature and amount of aid to be given to private schools. At the beginning of each calendar year, according to the English practice, a revised edition of the code is published in the Fort St. George Gazette.

799. MISCELLANEOUS GENERAL STATISTICS.—The statement at foot ^[52] shows the advance in the number of schools and scholars on the whole and for each principal section of the population for the ten years between 1875 and 1885. The number of schools rose by over 46 per cent. during the period. Attendance increased during the decade by 51 per cent. The Hindoo and Native Christian scholars

CHAPTER IX.

MISCELLANEOUS.

TIME, MONEY, WEIGHTS, MEASURES, &c.

800. **TIME.**—The English Government of this Presidency use for purposes of ordinary chronology, the calendar year beginning 1st January, for purposes of report to England the official year beginning 1st April, and for purposes of revenue collection the fusly or harvest year beginning 1st July. The first two adopt the usual European sub-divisions. The fusly is divided only by the periods of instalment of revenue due. No native measurement of time, the fusly excepted, is recognized by the Government. For legal purposes native dates of documents are translated into the Gregorian style, and periods of limitation are calculated according to that style. This latter provision is specially enacted by the Indian Limitation Act, India Act No. XV of 1877, section 25. The native measurements of time however are of the utmost importance to the population themselves, forming the basis of all their religious and most of their civil arrangements. The subject, which is extensive, is sketched in the foot-note.^[1] Current chronology is practically regulated among

[1] **SKETCH ACCOUNT OF THE ERAS AND CALENDARS IN USE IN SOUTHERN INDIA.**—*First Principles of Computation.*—It would be hazardous to give any detailed opinion as to the relative antiquity of the different component parts of the calendar system of Southern India; but some general observations are possible as to the natural origin of such conceptions, and one or two facts appear from the circumstances of the people themselves. The measure of time which is the first to be observed by mankind is the period of daylight, or interval between sunrise and sunset. The oldest Dravidian word for a day is pagal or daylight. The words naul indicating a solar day and night, and kizhamay indicating a fraction of a week, are of later origin. The period of daylight is variable in length even at the equator. And when any fixed point is taken in it the corresponding position of the sun will differ from day to day. That is to say, if there were a time-piece and a sundial the two would not proceed together. As a consequence the sub-division into fixed hours of equal length is unknown. The time of day is indicated by the height of the sun in the sky. This is still the habit among the agriculturists of Southern India. There is a Dravidian word ooroomaru for noon, but none for any further sub-divisions of the day. The word for the sixtieth part of a day and night, or 24 English minutes, is in Tamul nauligay which is taken from the Sanscrit naudica. Similarly vinandy or the 60th part of a nauligay. The terms moolhoortam "48 minutes" and nimisham "twinkling of an eye" are pure Sanscrit. The phenomenon which is the second to be observed by man is the return of the moon from new to new, making the lunar month called in science synodic. This, reckoning still by the number of sunrises and so with an occasional variation in the number of days to the month, is the second natural measure of time in order of origin. The civil lunar month varies between 29 and 30 days. This month prevailed in Europe until Julius Caesar in 46 B.C. substituted a solar year divided into artificial months "the Julian calendar." There is a Dravidian word tingal for the moon or natural month. The fishermen of this Presidency still calculate by months alone; being unobservant, at any rate as far as appears from their computations, of years or seasons. The same is the case with many hill-tribes. An agricultural population would very early notice the recurrence of the seasons, and hence the yearly position of the sun. This is the third step in computing time. The most primitive way of constructing a year is to put together 12 lunar months. This however being less than the solar year by 11 or 12 days would necessitate constant intercalations to bring the seasons into correspondence. The date of the origin of solar computation in India is unknown. When that was done, the civil year would still be reckoned by so many sunrises, and some intercalations would still be necessary. The most accurate solar year, or the return of the sun from a star to a star amounts to a mean year (allowing for nutation, which is the only known disturbing element) of 365 days 6 hours 9 minutes 9.6 seconds. It is called in Sanscrit *Madhyama sowra* means mean solar reckoning. There is an old Dravidian name *Aundu* for the year, but it is not known whether it was ever in use except for the purposes of the calendar. The different methods of applying these yearly and other computations to the affairs of history or civil occupation will be described in the succeeding paragraphs. (2) *The Kaliyog.*—According to the old Hindoo theory a day and a night of Brahma and the other gods consist of 1,000 mahayog or great yoges, each of these periods being 4,320,000 years. It is not certain whether these figures are wholly chimerical, or whether they are based on any astronomical fact. A mahayog is divisible under this system into 4 mundane yoges, diminishing in length in the arithmetical progression 4, 3, 2, 1. The connection between these figures and the total sum is apparent. Each yog is preceded by a period equal to 1/4th of itself, called the sandhyah or twilight; and succeeded by a similar period called sandhyamsha or part of twilight. The three first yoges of the present universe are past, and mankind now live in the fourth. The Krita "achieved" or Satya "truth" lasted with twilights 1,728,000 years. It is the equivalent of the golden age of Ovid. The Tretah (tra, to preserve) lasted similarly 1,296,000 years. It is the equivalent of the classical silver age. The Dwapara (dwa, two, part, after) lasted similarly 864,000 years. It is the equivalent of the brazen age. The Kali "age" began with the equinox in March 3102 B.C., and will last similarly 432,000 years. It is the equivalent of the iron age. The names of the yoges are said to be connected with the marks on dice. The era of the Kaliyog has at no time been expressly recognized in Southern India. But it has this in common with the Tamul era next to be described, that both are strictly solar-sidereal; and in fact the latter is merely the former with a new starting-point. At first the Kaliyog was affected by the precession of the equinoxes, causing a variation of one day in 60 years. But this was corrected in the year 969 A.D.,

the natives of Southern India by the name-years of the Jovian cycle, an institution which in its first origin appears to be earlier than the Aryan colonization. The division of the day is into four day and four night watches, making in all 60 Indian

when a fixed solar zodiac was introduced. The year of Kaliyog begins now always with the zodiacal sign Mesha "Aries" or about the 12th April. Thus the Sooryasiddhaanta or system of Kaliyog is understood in the greater part of India. In the southernmost part of the peninsula the original system is maintained under the name of Arya-siddhaanta retaining the error for precession. It is however used only by certain Malabar astrologers. The effect of the Kaliyog year on the civil year which reckons by sunrises, is to produce certain variations in the length of the months and to bring about a bissextile or leap year of 366 days about once in every 4 years. All this is provided in the Hindoo calendar. To find the year of the Kaliyog add 3101 to the Christian year A.D. (3) *The Shalivahana Saca and Ordinary Tamil Calendar System.*—The era adopted by the Tamilians is that called by this name, or simply Saca. Shalivahana "carried on the snail tree" was a Rajput king living at Pratishtaana on the Godavery in the first century of the Christian era. Saca is said to represent an Indo-Scythian or Tartar king reigning near the Indus over the people called Sacas by the classics, and defeated by Shalivahana. The name of the era would thus indicate a compound designation. It seems more natural to take Saca as an original term for era. The Shalivahana Saca dates from Monday the 14th March A.D. 78, year 3179 of the Kaliyog. It is first found mentioned by Varaha Mihira, the Hindoo astronomer of the sixth century; and was probably at first only a local computation, afterwards advanced by the authority of that writer into a popular and prevalent era. It appears to have been incorporated into the religious system of the Digambara "naked" Jains of Southern India. (4) It has been stated above that the Saca is only a derivative of the ancient Kaliyog. It uses the same astronomical starting-point and follows with one or two exceptions all its divisions. The first division is into six seasons and each season is again divided into two months, artificial, not lunar. Here follows a table showing these with both Sanscrit and Tamil names. Some of the latter are pure Dravidian. It is important also to observe that the whole Tamil year, including seasons and months, is shifted one month later than the Sanscrit year. This is perhaps due to the greater propinquity to the equator of the Tamuls, but in any case shows some independence on the part of the indigenous population. The civil Tamil year begins about the 12th April, being about 30 days later than the Sanscrit:—

(5) The number of days in each month given above is approximate, not being always the same in every year. The week or collection of seven days, sunrise to sunrise, is as follows in Sanscrit and Tamil:—

English names of days of week.	Sanskrit adding 'Vaura.'	Tamil adding 'Kishamay.'	Meaning of the Indian terms.
Sunday ...	Ravy or Aditya ...	Nyayir ...	Sun.
Monday ...	Soma ...	Tingal ...	Moon.
Tuesday ...	Mangala ...	Shovvey ...	Mars.
Wednesday ...	Bootha ...	Hoodhan ...	Mercury.
Thursday ...	Gooroo or Brihaspaty ...	Viyaanzhan ...	Jupiter.
Friday ...	Shookra ...	Velly ...	Venus.
Saturday ...	Shany ...	Shany ...	Saturn.

The Tamil names for all the days of the week are indigenous and Dravidian, except in the case of the planets Mercury and Saturn. These have the appearance of being derived from the Sanscrit. It is possible however that the converse is the case. The most recent researches show that the method of regulating days of the week by the names of planets was originally a Turanian not an Aryan conception. The way in which these particular names were assigned to the different days is as follows. Taking the planets, &c., on the geocentric system, they appear in this order; Saturn, Jupiter, Mars, Sun, Venus, Mercury, Moon. According to astrology each hour is ruled by a planet. Take then the first hour of Saturday as ruled by Saturn, and let the others follow successive hours in the order just shown. Then with the successive division of the days of 24 hours by this series of 7 planets, it will be found that the first hour of the other days will fall to the other planets in the order shown in the table. (6) The sub-divisions of the day under the solar system are according to the Brahmin astronomers of three classes; according as the day taken is from sunrise to sunrise, while the sun describes one degree of the solstic, or from rise to rise of one point of the ecliptic itself. The first-named or natural day is called savana, and its divisions are 60 ghata of 60 vinaudikah of 60 vipala. This day is constantly varying. The solar day proper is called sowra, and its divisions are 60 danda or kalah of 60 vikala. This day is longer or shorter as the sun is near the apogee or perigee. The ecliptic or true sidereal day is called nakshatra, and its divisions are 60 gharee or danda, of 60 vighatikah = 24 English seconds each, of 60 vipala .04 English seconds each or 6 prana "respiration" of 60 alipala of 60 kaushta of 60 nimisha of 60 lava of 60 kshana. Whether these minute sub-divisions are of any service must be determined by astronomers. It will be noticed that above this list 60 days nakshatra or dina make a ritoo or season; so that the computation by 60 is complete. From the remarks hereafter made, it will appear that this computation is probably a primitive Tartaric conception developed by the Aryans. In the Tamil country, and especially in the extreme south, the variation in the length of daylight is much less than in the north. In ordinary reckoning this is neglected. The daylight is divided into 4 jaunain or watches of 3 English hours or 7½ Indian hours nauligay each. The same for the night, but this is less frequent in civil life. Each Indian hour is calculated by an instrument called nauligay vattil, where a small vessel with holes in the bottom sinks in a larger vessel filled with water in that space of time. This is a variety from the clepsydra of the classics.

hours. It is possible that there is a connection between this hour-division itself and the Jovian cycle. The greater part of the population still regard the daylight only, or the period from the first appearance of objects close at hand in the morning to

In each nauligay are 60 vinsady. The Tamuls do not go lower than the vinsady in tabular reckoning. (7) *Orikhapirivitty Cycle*.—There is a Tamul cycle of 90 years, used for designating by names 90 recurring years of the Kaliyog, beginning B.C. 24 (year 3078 of the Kaliyog), to which the Brahmin astronomers of Madura and the south have given this title. It is said to be of ancient origin. It is based on the times of revolution of the sun and five planets. It has little practical application at the present day. (8) *Collam Aundus or Era of Parashoorama, or Malayalam Era*.—This prevails in Malabar and Travancore. It is divided into cycles of 1,000 years. The first cycle ended 178 B.C., the second 825 A.D., the third 1825 A.D. The year begins on the 15th September, except in leap-year. It follows the Kaliyog system. (9) *The Luni-solar System*.—Opposed to the Tamul solar-sidereal system, which agrees with the European, is another highly complicated system which takes both lunar and solar motions for its elements, and is exclusively the result of the Indo-Aryan critical faculty, having no parallel in any other part of the world. In the Telugoo country, and in countries further north beyond the Presidency, this luni-solar system furnishes an era called the Vicramaditya. And there have been one or two similar local eras. Even however where it has not succeeded in ruling the chronology, as for instance in the Tamul country, it has super-imposed its peculiarities for religious and ceremonial purposes on the solar systems. The great difficulties caused by this latter fact are what constitute the intricacies of the Indian calendars. The system is called the Chandramauna. The year under this consists of 12 lunar months, with an intercalary month once in about 3 years. The year begins at the true instant of conjunction of the sun and moon, that is on the new moon which immediately precedes the solar year. The day of conjunction is called 'amavasya.' In Southern India the series of months begin with this amavasya. In Northern India a different method prevails, and the system is still more complicated. From the year thus arranged together with details of the solar system arises the composite panchangam or Brahminical calendar, which may now be explained. (10) *The Brahminical Calendar deduced therefrom*.—The panchangam "five divisions" comprises the vaura or solar day from sunrise to sunrise, the tithy or lunar day sub-dividing the waxing and waning of the moon, the nakshatra or constellation for the day, the yoga or sum of the longitudes of sun and moon, and the karana or bi-section of the tithy. For the performance of ceremonies a Brahmin, and in a less degree other Hindoos, must follow each of these heads. The calculation of these measures of time is made by a few astronomers who have received the knowledge from tradition. The exposition of the panchangam is undertaken by a class called Jothies. (11) *Ditto, the Vaura*.—The vaura has been explained under the head of the Kaliyog. For astrological purposes, it is sub-divided into 24 hours. The ideas and title were borrowed by Varaha Mihira from the Greek, but he added that each hour should be ruled by a planet. The sub-division by sixties has already been explained. In Hindoo astrology the vauras answering to Tuesday and Saturday are unlucky days, and that answering to Sunday partially so. The Wednesday vaura is unlucky when Mercury is in the same constellation with either Mars or Saturn. These astrological points all arise out of the planetary influences. (12) *Ditto, the Tithy*.—Tithy cannot necessarily correspond with vaura. It begins at any moment of the solar day. It is $\frac{1}{24}$ part of the moon's synodical month, and varies with her motion from the sun. It ranges from 66 to 54 Indian hours. The tithies run for a fortnight only. The fortnight from new to full is called bright shoddha, shoocla or brightening; that from full to new is called dark bahoola, krishna, vadya or darkening. The following table shows the 30 tithies. The names after "new moon" and "full moon" are mere Sanscrit words for "first," "second," &c. The names of the deities to whom they are more especially sacred are added:—

Bright fortnight.		Dark fortnight.	
Amavasya, new moon ...	9-10, Pitrigaloo, orange-stars.	Poornimah, full moon ...	7-1, Chandra.
1. Paudyamy or Prata-mah.	11-1, Agny.	1. Paudyamy or Prata-mah ...	2-3
2. Bidige or Dwiteeyah ...	2-3, Brishma.	2. Bidige or Dwiteeyah ...	4-5
3. Tadige or Tritceyah ...	4-5, Parvuty.	3. Tadige or Tritceyah ...	6-7
4. Chowty or Chatoortee ...	6-7, Vigneshwara.	4. Chowty or Chatoortee ...	1-2
5. Panchamee ...	1-2, Adiaheshia.	5. Panchamee ...	3-4
6. Shashtee ...	3-4, Comarasawmy.	6. Shashtee ...	5-6
7. Saptamee ...	5-6, Soorya.	7. Saptamee ...	7-1
8. Ashtamy ...	7-1, Shiva.	8. Ashtamy ...	2-3
9. Navamee ...	2-3, The 8 Vasooa.	9. Navamee ...	4-5
10. Dashamee ...	4-5, The 8 elephants.	10. Dashamee ...	6-7
11. Yecaudashee ...	6-7, Yaman.	11. Yecaudashee ...	1-2
12. Dwaudashee ...	1-2, Vishnoo.	12. Dwaudashee ...	3-4
13. Trayodashee ...	3-4, Munmata.	13. Trayodashee ...	5-6
14. Chatoordashee ...	5-6, Kaleo.	14. Chatoordashee ...	7-8

(Same goes as bright fortnight).

The figures opposite each tithy show the proper karanas for such. It will be observed that the names of the tithies for the dark and bright fortnight are the same, yet the karanas will be explained later on. The fifteen days of each fortnight are divided for astrological purposes into five classes, having three days in each, thus:—Nandy contains 1st, 6th, and 11th, indifferent; Bhadrak contains 2nd, 7th, and 12th, good; Jayah contains 3rd, 8th, and 13th, good; Riktah contains 4th, 9th, and 14th, very bad; Poornah contains 5th, 10th, and 15th, good. During the riktah tithies no good work, such as marrying a wife, building a house, &c., can be commenced. A knowledge of the tithies is absolutely necessary to a Hindoo, for on them depends a proper performance of the funeral ceremonies to which he attaches so much importance. (13) *Ditto, the Nakshatra*.—The nakshatras are 27 in number, and are the constellations through which the moon in her monthly course passes. Great importance is attached to them in all astrological calculations. They are divided into male, female, and neuter; good, bad, and indifferent; and those which look upwards, those which look downwards, and those which look straightforward. Each nakshatra is divided into four parts called pada, and 2 $\frac{1}{2}$ nakshatras equal a rasi or sign of the zodiac. The nakshatras succeed each other throughout the month in the following order, and are each sacred to a particular god:—

1. Ashvinee, whose god is Ashvinee Devatah.	15. Swaaty whose god is Vayoo.
2. Bharanee or Andagan ...	16. Vishaakhah ...
3. Krittikah or Agneya ...	17. Anooradha ...
4. Rohinee or Brahme ...	18. Jyeshthah ...
5. Mrigashiras ...	19. Moola or Nirriti ...
6. Ardrah or Raudrah ...	20. Poorvashadha ...
7. Poorvassoo ...	21. Ootterashadha ...
8. Poorsha or Tishya ...	22. Shrivana ...
9. Ashlesha or Sharppam ...	23. Dhanishtah or Shrivishtah.
10. Maghah or Pitryah ...	24. Shatabhishah or Shatatau-rakab.
11. Poorvaphalgunee ...	25. Poorvabhandrapadah ...
12. Ootteraphalgunee ...	26. Ootterabhandrapadah ...
13. Hastah or Arakabha ...	27. Revatee or Powsahna ...
14. Chitrah ...	

their obscuration in the evening; and reckon no sub-divisions except noon and different apparent altitudes of the sun. For religious purposes the upper classes adopt the chronology of the Brahmins, whose system is based on the combined motions of the sun and moon; a system without any parallel in other countries in past or present times. Archæologists in Southern India are under the necessity of considering all the methods of chronology mentioned in the note, and some others; owing to the diversity of dynastic rules which have prevailed successively and simultaneously in this country.

In every nakshatra there is a time called *tyanjyayoga*, which lasts for $3\frac{1}{2}$ or 4 ghaligoyas (there is a dispute as to the actual length), and while it lasts nothing can be done, no work commenced. The *tyanjyayoga* comes sometimes by day, sometimes by night. The hour of its commencement is always given in the almanac. (14) *Ditt, the Yogas*.—These are 27 in number, and like the nakshatras, follow each other in regular order, thus:—Vishkambha, Preety, Ayashmat, Sowbhagya, Shobhana, Atiganda, Sookarman, Dhrity, Shoola, Ganda, Vriddhy, Dhroova, Vyaughauta, Harahana, Vajra, Siddhy, Vyalipanta, Varceyas, Parigha, Shiva, Siddhy, Sandhya, Shootha, Shookla, Brahman, Indra, Veidhrity. The *yoga* is nothing else than a mode of indicating the sum of the longitudes of the sun and moon. The rule for its computation, as given in the *Soorya Siddhanta*, Bhauvates, and *Graha Laghava*, directs that the longitude of the sun be added to the longitude of the moon, and the sum reduced to minutes, is to be divided by 800 (the number of minutes in $13^{\circ} 20'$): the quotient exhibits the elapsed *yogas*, counted from Vishkambha. It follows, therefore, that the *yogas* are 27 divisions of 360° of a great circle measured on the ecliptic. But if they be represented on a circle, it must be a movable one in the plane of the ecliptic. A more practical way for finding the proper *yoga* of the day is this. Find the nakshatra in which the moon is. This is the same as that for the day. Beginning with Shrivana the 22nd nakshatra, find what the number of this nakshatra is. (a) Find the nakshatra in which the sun is on the same day. This will be found from the sign of the zodiac. Then, commencing with *poosha* or 8th nakshatra, find what the number of this nakshatra is, or (B). Add a and B: the sum gives the number of the *yoga* for the day. If the result a + B is more than 27, subtract 27 or the total number of *yogas*, and the result gives the number of the *yoga* for the day. The length of a *yoga* varies from a maximum of 64 ghaligoyas to a minimum of 54 ghaligoyas, and does not necessarily agree with the tithy of the day. *Yogas* are divided into good, bad, and indifferent. (15) *Ditto, the Karans*.—Karanas are eleven in number, and divided into variable and invariable:—

Variable.			Invariable.	
1. Vava.	5. Gara.		8. Shakoony.	10. Nauga.
2. Vaulava.	6. Banij.		9. Chatooshpada.	11. Kintooghna.
3. Kowlava.	7. Vishy.			
4. Teetila.				

They answer successively to half a tithy or lunar day, Kintooghna being always assigned to the first half of the first tithy, and the variable karans succeeding each other regularly through eight repetitions. They are followed by the three remaining invariable karans, which conclude the month—Chatooshpada and Nauga appertaining to *amavasya* or the new moon, and Shakoony being appropriated to the latter half of the preceding tithy. (16) *The Vicramaditya era*.—This has been mentioned above as the principal era established by the exponents of the luni-solar system. It obtains among the Northern Telugos of this Presidency, and is the characteristic era of the Swetambara or white-robed Jains of the north. In the north of India it is called "Samvat," and hence the common word "Samvatsaram," used even in this Presidency for a year. It began in the year 57 B.C. The year opens slightly before the solar year for the reason given above in describing the principles of the luni-solar year. (17) *The Cycle of Vikaspathy*.—This *Briliuspathyakra* is a cycle of 60 years based originally on the revolutions of the planet Jupiter. Jupiter revolves in the heavens once in about 12 solar years, and this multiplied by 5 gives 60. The system is common to all nations of the extreme east, and is rather a Tartaric than an Aryan notion. The Tamuls and the Tibetans equally reckon their age in domestic affairs by periods of 12 years. It is only in the adaptation of this cycle to the Brahminical system that the original factor of 12 years is overlooked. In that system there are 60 distinct names for each year of the 60-year cycle. Whatever its meaning at first, in practice at the present day the Tamuls give the cycle names to 60 of their solar years, and the Telugos to 60 of their luni-solar years. In formal dates it is and always has been the custom to add the cycle year-name to the era year-number; and in common usage the year-number is omitted altogether. The names will be seen in the table which concludes this note. They are all from the Sanscrit. In Bengal the cycle is 11 years in advance of Madras. (18) *Tooloo season year*.—A Tooloo calendar exists on the west coast, which has Dravidian terms for 10 out of 12 names of the months. These terms represent the crops harvested in those months. The arrangement of the months agrees as at present observed with the luni-solar system. The names of the twelve months are as follows:—Pagy, Besha, Kartail, Auty, Sona, Nirnaula, Bontail, Jaurde, Fernaurde, Pooyintail, Mayi, Sooggy. Of these Besha and Auty alone are from the Sanscrit. It is probable that the Dravidians had a seasonal calendar before the Aryan invasion. Though the Tamuls have later on adopted the solar system, it may be conjectured that the earliest Dravidian calendar was wholly lunar. (19) *Years of reigns*.—In inscriptions dates are frequently found bearing no other year date than the year of the reign of a particular king. (20) *Intercalations, &c.*—Mention has been made above incidentally only of the modifications necessary to reconcile astronomical and naturally observed periods. But in religious and ceremonial matters they exercise an important influence, even leading sometimes to sectarian dispute. They take the form not only of intercalating periods as in Europe, but also of expanding them. They are particularly noticeable in the Brahminical luni-solar system. An intercalated period is called *adhika*, and in former days no legal or state document could be executed during its currency. This is not the case at the present day however, except among the strictest Brahmins. The solar calendar furnishes scarcely any date-festival; the lunar calendar nearly all of them. But this does not touch the question of festivals special to temples and localities, which is the more indigenous method. (21) *The harvest era called fusly*.—The fusly harvest era was originally instituted by Acbar, who desiring to have a uniform year for revenue purposes throughout his empire arranged a system under which the first year of his reign (1556 A.D.) should take the number of the Mahomedan Hijra, and proceed from that as a new starting-point. This was to be applied to all systems then existing. It does not appear whether it was understood that the synchronism could be only temporary. Even if all the other eras were regarded as mutually compatible, they could none of them long agree with the Hijra, which is not a luni-solar, but, an absolute lunar system. The *Vicramaditya* or *Samvat* era of Bengal of that day gave 1612 as the year, the Hijra era 963. The *Samvat* year accordingly became 963, and the new era was named fusly. It loses more than three years in a century as compared with the figures of the Hijra, and is now 11 years behind the present Hijra. Nor has it in any way superseded the ordinary *Samvat* reckoning, which still continues. What has just been described is the Bengal fusly. The arrangement did not take effect in the Deccan or Carnatic until nearly a century later under Acbar's grandson Shah Jehaan. This emperor after bringing his wars in the Mahratta country to a conclusion in 1636, took steps for settling the country and introducing the revenue system of Todar Mull, his grandfather's celebrated minister. With the survey and settlement came naturally the revenue year. It was dated from the year 1591 A.D., or Hijra 1247 which latter number it took. The Hijra however had by that time advanced nearly three years on the first fusly. Consequently the new fusly bore a figure higher by three than the old. This is still the case. The Madras fusly is three years numerically in advance of the Bengal fusly. Seasonally the Tamil fusly or husbandman's year (called in the north 'mrigeasi'), begins with the end

801. MONEY.—The sums of money recognized by the Government at the present day in this Presidency for purposes of account are represented by fractions or multiples of the Government rupee (the standard unit of all money transactions in India), in accordance with the following table:—12 pies make 1 anna, 16 annas make 1 rupee, 100 thousand rupees make one lakh of rupees, 100 lakhs or 10 millions of rupees make one crore of rupees. The various sub-divisions or fractions of a rupee represented by independent coins in silver or copper are shown below^[2] with their respective values, weights, and degrees of fineness or purity as

of Veiyasuy and beginning of Aady, or about the 12th June; when the fields begin to be sown. Astronomically it begins at the same time, being merely the postponement by two Tamil months of the solar-siderial year. The Madras Government fixed its commencement one month later, on 12th July, but from 1855 the date has been changed to 1st July. There is nothing to prevent the Tamil months being quoted along with the fusly, and formerly this was done in the titles to regulations and in other state documents. But at present the fusly is only used for the revenue demands and it has no divisions practically other than those of the periodic kists or collections. The kharreef of the north is the first half of the fusly, and the rubbee is the second half; these terms are not used in the Madras Presidency, where the period of the crops and harvests is less precise. (22) *The Mahomedan Hijrah era.*—This dates from the flight of Mahomed to Medina, which took place in the night of Thursday, the 12th July, A.D. 622. The era commences on the following day, viz., the 13th July. Many chronologists have computed this era from the 16th of July; but it appears that in most ancient times the 16th was the first day of the era, and now there can be no question that such is the practice of Mahomedans. The year is purely lunar, consisting of twelve months; each month commencing with the appearance of the new moon. It is obvious that by such an arrangement every year will begin much earlier in the season than the preceding; being now in summer and in the course of sixteen years in the winter. It must also be remarked that, as the Mahomedans begin each month with the appearance of the new moon, a few cloudy days may retard the commencement of a month, making the preceding month longer than usual. This in fact is the case, and two parts of the same country will sometimes differ a day in consequence. However the clear skies of those countries where original Islamism prevails, rarely occasion much inconvenience on this head. In chronology and history, as well as in all documents, the Mahomedans use lunar months of thirty and twenty-nine days alternately, making the year thus to consist of 354 days; eleven times in thirty years, one day is added to the last month, making 355 days in that year. Consequently, the average length of a year is taken at $354\frac{1}{3}$ days, the twelfth of which is $29\frac{1}{2}$, differing from the true lunation very little more than three seconds, which will not amount to a day in less than 2,260 years; a degree of exactness which could not have been attained without long continued observations. An intercalary year of 355 days occurs on the second, fifth, seventh, tenth, thirteenth, fifteenth, eighteenth, twenty-first, twenty-fourth, twenty-sixth, and twenty-ninth years of every thirty years. It is evident however that between the intercalations the years do not correspond with any seasons. Any year being given, to know whether it be intercalary or not, divide by thirty; and if either of the above numbers remain, the year will be one of 355 days. The names of the months, as used by the Mahomedans, with the length of each, are as follows:—

Moharram	30	Rajab	30
Safar	29	Shabaan	29
Rabi'ah I	30	Ramzan	30
Rabi'ah II	29	Shawwal	29
Jomady I	30	Zil kaus	29
Jomady II	29	Zil hauj	30

The Mahomedans have weeks of seven days, named as follows:—

Days.	In Persia.	In India.
Sunday.	Yakshamba.	Etwar.
Monday.	Dooshamba.	Peer.
Tuesday.	Sishamba.	Mangal.
Wednesday.	Charshamba.	Boodh.
Thursday.	Panjshamba.	Joomeraut.
Friday.	Jooma or Audina.	Jooma.
Saturday.	Shamba or Hafta.	Sancechar.

(23) *Table.*—The table in Vol. II, App. XXXVI, exhibits the correspondence of the Christian, Cyclic, Kaliyog, Saka, Quilon, Vicramaditya, Fusly, and Hijrah years, for the period between 1840 A.D. and the end of the present century; or a period sufficient to show one of the Jovian cycles of Vrihaspaty in every-day use among the Brahmans of this Presidency. The columns are taken in the order of the frequency of their ordinary use.

[2] SILVER AND COPPER COINS, VALUE, WEIGHT, AND FINENESS.

	Weight.	Pure silver.	Alloy.
Silver coins.			
	GRAINS.	GRAINS.	GRAINS.
A Government rupee equivalent to 16 annas	180	165	15
A half-rupee or an eight-anna piece	90	82½	7½
A quarter-rupee or a four-anna piece	45	41½	3½
An eighth of a rupee or a two-anna piece	22½	20½	1½
Copper coins.			
A half-anna or double pice equal to 6 pies or ⅙ of a rupee	200
A quarter-anna or single pice equal to 3 pies or ⅓ of a rupee	100
An eighth of an anna or half pice equal to 1½ pies or ⅛ of a rupee	50
A pie or ⅙ of an anna or ⅓ pice equal to ⅙ of a rupee.	33½

compared with the rupee. There are at the present day no separate coins in silver or copper representing the single anna, apparently because a coin of the former metal would be too small and one of the latter too large for ordinary use. The use of the vernacular term 'peisah' or the corresponding English word 'pice' for a quarter-anna is discouraged as much as possible, the term being liable to be confounded with the Anglicized word 'pies' the plural of pie. Ninety-rupees' worth of pies weigh 576,000 grains Troy, or 82½ lb. Avoirdupois. A lakh of full-weight rupees weighs net 31½ maunds. Copper coin of the nominal value of Rupees 2½ weighs 1 seer. The mints are required to coin on demand the third mohur, the two-third mohur, the mohur, and the double mohur of the weight and fineness shown below.^[3] No gold coin is legal tender, but mohurs are accepted at Government treasuries in payment of Government dues provided they have not lost above one part in five hundred of their weight. So are also sovereigns and half sovereigns (of the Royal Mints of England and Australia) which are accepted at a rate of Rupees 10-4-0 and 5-2-0 respectively provided they do not weigh less than 122¾ and 61½ grains respectively. Gold coins are not however re-issued from the Government treasuries without special orders from the Account Department. The coinage is Imperial, and takes place at present in the Bombay and Calcutta mints only, all coinage operations having been discontinued in Madras from 1st September 1869 on the abolition of the Madras mint under the orders of the Secretary of State. The mints receive gold and silver bullion or coin fit for coinage in quantities of not less than 50 tolahs for gold and 1,000 tolahs for silver, and levy duties at the rate of 1 rupee per cent. on the produce of gold bullion or coin and 2 rupees per cent. for silver, besides a charge of ¼ per mille on gold and 1 per mille on silver for melting and cutting such bullion or coin. Additional rates are charged for inferiority to the standard quality or fineness. Receipts are then granted to proprietors which entitle them to certificates from the Assay Master for the net produce of such bullion or coin, payable at the treasury. Proprietors dissatisfied with the decision of the Assay Master can withdraw the bullion or coin tendered by them within twenty-four hours after the report, on payment of a certain fee, but without deductions on account of the duties above named. The table at foot^[4] shows the value of total British coinage in India for twelve recent years. The receipts of the Mint department are mainly from the seigniorage duty on coining silver; the receipts however do not cover the charges. The diameter of the silver coins is fixed departmentally at ¾ of an inch for the quarter-rupee, ⅞ of an inch for the half-rupee, and 1½ of an inch for the rupee. The nominal or par value of the rupee is two shillings, but the real value now is about 1 shilling 7½ pence, owing to the depreciation of the value of silver in relation to gold. With the rupee at the rate of two shillings the pie equals half farthing, the anna three half-pence, the gold mohur thirty shillings, the lakh ten thousand pounds, and the crore one million sterling. This is called the conventional rate of exchange as distinguished from the official

[3] GOLD COINS, VALUE, WEIGHT, AND FINENESS.

rate of exchange, which is fixed for each year by the Secretary of State for the adjustment of public transactions between England and India. Prior to 1870-71 the rupee had the value of 2 shillings. From the table at foot [*] exhibiting the rates prevailing in each year since then it will be observed that the former equilibrium between gold and silver has been greatly disturbed. As already observed, no gold coin, whether Indian or otherwise, is a legal tender anywhere in British India. Rupees and half-rupees are legal tender for all sums, if they have not lost more than 2 per cent. in weight and have not been reduced in weight otherwise than by use. The smaller silver coins are current subject only to the second proviso, and like copper coins are legal tender only for fractions of a rupee. Coins issued by the authority of the Portuguese Government are coined on behalf of that Government by the Government of India, and are legal tender throughout British India to the same extent and subject to the same conditions as corresponding silver and copper coins of the British Indian currency. The Act specially regulating the British coinage and mint is India Act XXIII of 1870. As in the case of the Portuguese Government, the Government of India generally strikes all the coins required for native states in the British mints. Section 3 of India Act IX of 1876, the Native Coinage Act, prescribes the conditions under which coins made for or issued by native states may be declared by Government to be legal tender in British India. The natives of this country are expert at manufacturing base money and have been known to extract all the interior of a rupee filling it up with lead. Certain officers of Government banks, municipalities, &c., have been specially empowered to cut and break coin which they believe to be counterfeit or unduly worn; and they are protected by the law from liability to prosecution. Rupees and half-rupees having by reasonable wear lost more than 2 per cent. of their weight are cut and broken, and, at the option of the tenderers, returned to them or retained by Government, the equivalents being paid to them at the rate of 1 rupee for 180 grains Troy. Small silver coins unfit for circulation by reason of the obliteration of the device upon them or other cause are cut and broken; all coins so broken being ultimately sent to the mint for re-coinage. Uncurrent copper coins, however much worn, are exchanged for good copper coins without extra charge. As far as the balances in the treasuries allow of it, copper and small silver coin are issued to persons wishing for either, the order that copper should only be issued when applied for in parcels of the value of 5 rupees having been cancelled. Silver in exchange for legal tender copper coin is likewise issued in parcels of the nominal value of not less than 2 rupees. Special arrangements are made for this purpose wherever large bodies of laborers or others are assembled for public works, &c., the object being to prevent legal tender copper coin from circulating at a discount. The old native systems of coinage once prevailing in the Presidency are described in the foot-note.[*] It will be seen that the Hindoo currency had a gold standard,

[*] SKETCH HISTORY OF SOUTH INDIAN COINAGES.—*Hindoo coinages.*—The unit of the old Hindoo coinage in Southern India was a gold coin of about 50 grains' weight; say of the value of 3½ modern rupees, or seven shillings. They were called by various names according to the image they bore, but the best known term is *varauha* or 'wild boar,' derived from Vishnoo's boar avatar or incarnation. A double *varauha* was often coined. These two coins would approximately correspond to the drachma and di-drachma, *χρῆσος* and *διχρῆσος*, of the Greeks. The *varauha* was called 'hoon' (old Canarese for gold) by the Mussalmans; and has been called, in consequence of the device found on many specimens, 'pagoda' by the English. The *varauha* was divided into 16 *panam*; also a gold coin, but usually much alloyed; say of the value of 3½ modern annas, or five-pence farthing. There was no silver coinage. The copper coinage was quite indeterminate; the principal coin being a *caus* or *cash*. The Hindoo coinage continued alongside of the subsequent Mahomedan coinage. The principal coinage of the south was that of the Ikkaury Rajah of Mysore, who had mints at Mysore and Bangalore. He coined the *Sadashiva* hoon, so called from a former rajah. They bore the figures of Shiva and Parvaty on one side, and a *pagoda* on the reverse. During the usurpation of Hyder and Tippoo, *Bahaudry* and *Sultauny* hoon were struck at Mysore. The former are distinguished by the initial of Hyder's name. At Travancore also hoon were coined called *Anandaroy*, after a prince of that name. (2) *Mahomedan coinages.*—The Mahomedans introduced a silver currency. Their earliest currency was a gold *deenaar* (*denarius auri*), value say 2½ modern rupees, or five shillings; a silver *dirhem* (drachma) weighing from 40 to 50 grains, say ten pence; and a copper *faloo* or small coin. As the silver drachma was the unit in ancient Greece, so the *dirhem* was the unit in Persia and Arabia, whence this currency was imported. The term *deenaar* is now used in Southern India for any gold coin, the *dirhem* has passed unnoticed, the *faloo* has been coined under that title in the south for a three-pie piece. Later on the Mussalman coinage took the form of a gold *mohur* or *seal*, say 16 rupees; a silver rupee (*roopyah* = silver); and a copper *daam*, say one half-penny.

and that the silver standard was introduced by the Mussalmans. Details of law relating to coinage are shown in Vol. II, App. LIV, under the title of Coin.

802. WEIGHTS.—The orders of Government relating to weights cannot be understood except as part of the whole question of weights prevailing in Southern India. The ponderary measures which are most indigenous to this part of the country are the following:—The coondrimany or other seed weight (scarcely determinate, say 2 grains English or $\frac{1}{16}$ of an oz. avoirdupois), the gold pagoda weight (about 54 grains English or $\frac{1}{8}$ of an oz. avoirdupois), the pollum (about $1\frac{1}{4}$ oz. avoirdupois), the viss (about 3 lb. avoirdupois), the toolaum (about 20 lb. avoirdupois), and the baurum (about 500 lb. avoirdupois). In the Northern Circars the weight of the copper 'dub' coin (about $\frac{1}{4}$ an oz. avoirdupois) takes the place of the southern pollum. Other weights more or less in common use, but introduced within modern times from northern provinces, are the following:—The tolah or silver rupee weight (about $\frac{3}{4}$ of an oz. avoirdupois), the seer (say 10 oz. avoirdupois), and the maund (about 25 lb. avoirdupois). The seer just mentioned is called the cutcha (inferior) seer, to distinguish it from the pukka (regular) seer of the north, hereafter to be mentioned. There are numerous local weights in addition to the more general weights. All these weights are deduced originally from the weight of some stamped or coined piece of metallic money, and those tokens having varied in weight according to the mints which produced them, the ponderary scales which combine them have similarly fluctuated. The number therefore both of different values and different scales in Southern India is very great. The principal ponderary scales that need be considered at the present day in this Presidency are the five following.[7] First, the scale derived originally from the unit of the gold pagoda. This does not range now higher than the seer, and in its use is confined to jewellers and druggists. It is sub-divided into two

The first rupee is said to have been struck by Shere Shah who took the throne of Delhi from Hoomayoon, and took this means of commemorating his reign. It then weighed about 178 grains of what was held to be pure silver. The coin had on one side stamped on it the Mahomedan creed, on the other the emperor's name and date in Persian; both sides having an annular Hindoe inscription. Achar issued a rupee of the same weight and value, but square, called Jelaulce. The names of the four friends of the Prophet, Abou bakr, Omar, Osman, and Ally, were inscribed on the four sides, for which reason the people regarded it as having talismanic power. In the decline of the Moghul empire every petty chief coined his own rupee. These still bore the name of the reigning emperor, but varied indefinitely in weight and value. The Nawabs of the Carnatic ruling at Arcot had in the eighteenth century a rupee of 177 $\frac{1}{2}$ grains and 170 pure silver. (3) *English Coinages.*—The English Government at Madras at first recognized both the Hindoe and the Mahomedan coinages. The table of the former adopted for their accounts was 10 cash equal 1 doody or dooggauny (value about 2 pies), 2 doodies equal 1 dub (value about quarter-anna), 4 dubs equal 1 silver fanam (value about $1\frac{1}{2}$ anna), 45 fanams equal 1 gold star-pagoda (value 3 $\frac{1}{2}$ rupees). The dub or largest copper coin passed into a general term for money. Fanam is the Tamul word panam, meaning money. The star-pagoda of the Madras mint had on one side the figure of the goddess Bhagavaty, and on the other a star. It weighed 52.56 grains, and was 42.7 grains pure gold. This table was for a long time the principal one in use by the Madras Government. During the last half of the eighteenth century the Mahomedan Nawab's Arcot rupee passed current in Madras. When on the cession of the Carnatic in 1801 the Madras mint was set up, rupees were coined by the Madras Government, of 176.4 grains with 166.48 pure. In 1818 this standard was altered to 180 grains with 166 grains pure. This was in 1835 (India Act XVII of 1835) adopted as the weight of the rupee for all India. The 1773 Sicca (scal) rupee of Bengal, weighing 179 $\frac{1}{2}$ grains with 175.23 grains pure, was at no time current in this Presidency. The 1835 rupee was struck in supersession of all Presidency coinages. It bore on one face the head and name of the reigning sovereign of Great Britain, and on the other the designation in English and Persian with the words East India Company in English. The anna is merely a Mahratta term for a sixteenth. A single anna piece in silver, equivalent to $\frac{1}{16}$ of a rupee or 12 pies (containing 10 $\frac{1}{2}$ grains of pure silver and $\frac{1}{4}$ of a grain of alloy and weighing 11 $\frac{1}{2}$ grains) was in existence prior to Act XVII of 1835, 208,000 pieces of the value of 13,000 rupees having been struck in the Madras mint in 1835-36. The coinage of 1 anna pieces was discontinued from 1st September 1835, and there are now no separate coins in silver or copper representing 1 anna. The new Coinage Act, India No. XXIII of 1870, has not changed the weight or composition of the rupee. (4) *Miscellaneous Uncurrent Coins.*—The following local varieties of coins now uncurrent, may be mentioned. The 'Madras' or Mitta pagoda used in Nellore, Goontoor and other former Nawab's districts = 3-15-7 $\frac{1}{2}$ or 100 to 385 Arcot rupees. It was divided into 52 fanams, and each fanam into 80 cash. The 'Three Sawmy' pagoda was about 20 $\frac{1}{2}$ carats (twenty-fourths), or .860 fine. The 'Porto Novo' pagoda about 17 $\frac{1}{2}$ carats, or .720 fine; the exchange used to be 120 Porto Novo pagodas for 100 star, or 1 Porto Novo pagoda = 36 fanams in Government accounts, and 37 $\frac{1}{2}$ in the bazaar. The 'Canteroy' pagoda of Bellary and Cuddapah = 2-14-8 or 2.917 rupees. It is now a coin of account merely, and subdivided into 10 fanams of 4 $\frac{1}{2}$ annas each. The 'Bahaudry' pagoda of Mysore = 3-9-8. The 'Cully' pagoda or poon = 2-12-0, and contains 10 fanams, each of .212 rupees or 3 annas 4 $\frac{1}{2}$ pies; and each fanam = 80 cash. The 'Shooly' pagoda or chuckram of the South Carnatic = 1-165 rupees or 3 to a star-pagoda; divided into 10 fanams, each = 1 anna 10 $\frac{1}{4}$ pies. The 'Pulliput' pagoda of Trichinopoly = 2-10-0. The 'Gopauly' chuckram or poon of Trichinopoly = 1-2-8, divided into 10 fanams and each fanam into sixteenth. The 'Tanjore' gold chuckram = 1-8-10, divided into 10 gold fanams, and each fanam into 32 cash; each fanam = 1 Madras double fanam of silver. The Malabar 'New Veeroe' pagoda = 2-13-8 $\frac{1}{2}$; it is divided into 10 fanams of 4.57 annas each, or 8 $\frac{1}{2}$ fanam = 1 rupee; the fanam is divided into 40 cash. The 'Old Veeroe' fanam = $\frac{1}{4}$ rupee.

[7] THE FIVE PRINCIPAL TABLES OF WEIGHTS IN USE IN SOUTHERN INDIA.

(1) Native jewellers' and druggists' weights.

Teloogoo Districts.	
9 Chinnams	= 1 Pagoda weight.
4 Pagodas	= 1 Dub.
1 Dub	= 1 Tola, or 30 Chinnams.
24 Tola	= 1 Cutcha Seer.

Tamul Districts.	
9 to 10 Fanams	= 1 Pagoda weight
10 Pagodas	= 1 Pollum.
8 Pollums	= 1 Cutcha Seer.

varieties, according as the Teloogoo dub or Tamul pollum is used. The values vary with the weight of the pagoda, which ranges according to locality from 525 to 560 grains English. They can be roughly inferred from what has been stated above. Secondly, the scale which is composed of the old weights of Southern India when referred to the Mahomedan and English silver rupee weight or tolah as a standard. Before the last half century this must have varied nearly as much as the gold pagoda scale. Since 1835 however when the British Government fixed the weight of the rupee or tolah at 180 grains English, it has been open to those who used the scale to adopt determinate quantities, and this has been very generally done. This scale is the ordinary trade scale of the interior of the country. Thirdly, the scale recognized by the Madras Government for departmental use in all matters other than those having an Imperial bearing. When the tolah under the last mentioned head is the Government tolah, this official scale is merely an extract from that scale. The values in Troy and Avoirdupois are given in this case in the table, opposite the weights, taking the present British tolah of 180 grains English. The convertibility is easy in the case of Troy weight, a coincidence which doubtless had some effect in determining the value chosen by the Government of India for the tolah. Fourthly, the scale which has been just mentioned modified by English merchants to facilitate conversion into the avoirdupois of English commerce. The correspondence of one tolah to 180 grains English is situated too low in the scale for purposes of conversion to avoirdupois. The pollum has therefore been raised in this instance to $1\frac{1}{4}$ oz. avoirdupois exact, the viss then becoming $3\frac{1}{8}$ lb., the maund 25 lb., and the candy 500 lb. This scale is used by all English merchants and tradesmen. It prevails especially in Madras town, and is recognized and enforced by the Madras collectorate. Superior native dealers also use it in all the districts. Fifthly, the scale instituted by the Government of India in 1833 taking the same tolah of 180 grains English as the unit; but creating a seer and a maund which while not deviating materially from the weights of those names to be found in Bengal, corresponded intimately, like some of the southern weights, with the Troy scale. This scale is used in the Madras Presidency for purposes of the railway departments, salt administration, and of general statistics. Besides these five scales might be mentioned that of India Act XXXI of 1871, where the seer is equal to the French kilogramme, or 2.205 lb. avoirdupois. This however is merely a theoretical scale as far as this Presidency is concerned, the Act not having been applied to it. The ponderary scales have here been classified; but even then there remain many local varieties. The local weights prevailing in each district are shown in Vol. II, App. XC.

(2) *Weights used in ordinary native trade.*

10 Pagodas weight = 1 Pollum = 3 Rupees.
 8 Pollums or 24 Rupees = 1 Cutcha Seer.
 80 Rupees = 1 Pucka Seer.
 40 Pollums, or 5 Cutcha Seers = 1 Viss.
 8 Viss = 1 Maund.
 20 Maunds = 1 Candy.

(3) *Weights recognized by Government.*

Madras weights.	English Troy.			English Avoirdupois.		
	LB.	OZ.	DWTS.	LB.	OZ.	DWTS.
1 Tolah	0	0	$7\frac{1}{2}$ (= 180 grains).	0	0	$6.582\frac{1}{2}$ (= 180 grains).
3 Tolahs = 1 Pollum	0	1	$2\frac{1}{2}$	0	1	$3.748\frac{1}{2}$
40 Pollums = 1 Viss	3	9	0	3	1	$5.942\frac{1}{2}$
8 Viss = 1 Madras Maund ...	30	0	0	24	10	$15.542\frac{1}{2}$
20 Madras Maunds = 1 Baurum or Candy.	500	0	0	408	11	$6.867\frac{1}{2}$

(4) *Weights used by European merchants and superior native traders.*

1 Pollum = $1\frac{1}{4}$ oz. avoirdupois = (5,546.9 grains).
 40 Pollums = 1 Viss = $3\frac{1}{4}$ lb.
 8 Viss = 1 Maund = 25 lb.
 20 Maunds = 1 Candy or Baurum = 500 lb.

(5) *Imperial weights of the Government of India.*

80 Tolahs = 1 Seer.
 40 Seers = 1 Imperial Maund (82½ lb. avoirdupois.)

803. LINEAR MEASURES.—No Government order has been passed on this subject. The basis of linear measure in the south of India is the moolum, sometimes called 'cubit'; this is the distance from the elbow to the tip of the middle finger of a full-sized man and averages about 19·7 English inches. A table is given below based on a combination of the native measures with the English yard; this is in general use and may be taken as approximately correct with reference to the equivalence of the English and native measures.^[*] There is another 'ungoolam' differing from that shown in the note, and signifying the distance from the thumb-joint to the tip of the nail; this is about $1\frac{1}{4}$ of an English inch. Of these 24 make a gajam. The Tamuls have an 'adee' or foot, averaging $10\frac{1}{4}$ inches; but it does not hold its ground against the English foot. The gajam of this Presidency varies from 26 to 39 English inches, but this is equally being superseded. In Madura and Tinnevely the tutchacole or carpenter's stick is equal to 33 English inches. In Trichinopoly the same measure is called tutohamoolum or carpenter's cubit. The 'bauham' or fathom is 6 feet $4\frac{1}{4}$ inches English in Salem and Coimbatore, but is 6 feet $6\frac{1}{4}$ inches English in Goontoor. The expression 'nauzhivazhy' in Tamul means the road or distance that can be walked in a nauzhigay or 24 English minutes, and stands for about $1\frac{1}{2}$ English miles. Seven nauzhivazhy make one caudam.

804. SQUARE MEASURES.—No Government order has been passed on this subject. In square measure the native land-measure which still holds its ground is—144 inches = 1 square foot, 2,400 square feet = 1 munny or ground, 24 munnies = 1 cawny, 484 cawnies = 1 square mile. The cawny is in proportion to the English acre as 121 to 160. The use of the English acre is becoming very frequent. In Vol. II, App. XC, are given the varieties of land-measure for the whole Presidency.

805. MEASURES OF CAPACITY.—The scale of measures of capacity, dry and liquid, used in Government transactions is—8 ollucks = 1 measure or puddy, 8 puddies = 1 mercaul, and 400 mercauls = 1 garce. The olluck here contains $12\frac{1}{2}$ cubic inches English, and 20 ollucks are equivalent to 1 English gallon. The table at foot shows the exact dimensions of the Government measures of capacity.^[*] The Government recognize also a parrah of choonam, made of 5 mercauls; this contains 4,000 cubic inches, English. The Imperial measure of capacity, which it was the object of Act XXXI of 1871 to introduce (= a measure containing one Imperial seer of water at its maximum density, weighed in a vacuum), has not yet been applied to this Presidency. It cannot be said that the Government measures of capacity are at all prevalently adopted by the people. In fact in the greater part of the Presidency there are no actual measures of capacity, these measures depending in reality on the weight of different commodities used in connection with them.

[*] MADRAS LINEAR MEASURE WITH INCORPORATION OF THE ENGLISH YARD.

4 Ungoolams or Thumbs-breadth	= 1 Hand-breadth or digits-breadth.	2 Moolums	= 1 Yard or Gajam.
2 Hand-breadths	= 1 Span.	2 Gajams	= 1 Fathom or Tundam.
2 Spans	= 1 Cubit or Moolum.	2,000 Tundams	= 1 Coss.
		4 Coss	= 1 Caudam (10 miles).

[*] GOVERNMENT MEASURES OF CAPACITY.

Measures.	Depth and diameter inside, in cylindrical inches.	Size for practice, in inches.	Capacity in cubic inches.	Weight of rain-water contained by each measure, the water being at 80° of Fahrenheit's thermometer in lb. Avoirdupois.			
		Diamr. Depth. Square. 20 × 20 × 10 Cylindric.		LB.	OL.	DRS.	GRS.
Parrah	17·2050		4,000	144	0	5	0
Mercaul	10·0616	10·8	800	28	12	13	22
$\frac{1}{2}$ mercaul	7·9859	8·2	400	14	6	6	24
$\frac{1}{4}$ do.	6·2384	6·8	200	7	3	3	13
Measure (Puddy)	5·0308	5·0	100	3	9	9	20
$\frac{1}{2}$ measure	3·9930	4·0	50	1	12	12	23
$\frac{1}{4}$ do.	3·1692	3·2	25	0	14	6	12

$\frac{1}{2}$ olluck	1·9965	2·0	6 $\frac{1}{4}$	0	3	9	17
$\frac{1}{4}$ do.	1·6646	1·6	3 $\frac{1}{4}$	0	1	12	22

Thus the seer measure is understood to be a measure which when "heaped" or poured into the measure so that the grain stands in a cone at the top, will contain a seer weight of rice. A "struck" measure, which is less usual, is that in which the cone of grain has been swept off with the flat of the hand leaving the surface of the measure flush. In the neighbourhood of Madras on the other hand and in some of the southern districts, the ordinary grain measure is a "puddy" which, though variable, does not represent any weight. Oil, ghee and milk retail are the only articles for which liquid measures are used. The smaller grain measures are used in these cases. Spirituous liquors are sold by the English bottle; and by the "dram" which is considered $\frac{1}{16}$ of the old English wine gallon of 231 cubic inches, being thus itself 5.775 cubic inches. App. XC in Vol. II gives the local varieties of measures of capacity. For the purposes of the returns of food prices sent to the Government of India, a thorough comparison was some years ago made of the local food measures in use, taking the form of a conversion of capacity measures into weight measure. In each locality it was ascertained what was the recognized measure of capacity used for selling grain and salt, what was the capacity of this measure in cubic inches, and how much weight of ordinary rice it contained in terms of the tolah or rupee weight. The ratio between the weight of ordinary rice and that of other grains and of salt having then been arrived at by two independent methods, similar results were established for the other commodities. In establishing the ratio between grains and rice, one ratio for the whole Presidency was decided on; in the case of salt however the variations in different districts, owing to reduction of weight by transport to places distant from source of supply and other causes, were so considerable that several ratios had to be taken for the whole Presidency. The Board of Revenue, who made these calculations, are acquainted thereby with the weight of each principal commodity contained in each of the local measures; and when the bi-monthly returns showing the number of measures of each commodity sold for a rupee reach them from the districts, they are in a position to issue tables showing their price lists in terms of a single common weight. At present the unit of weight adopted for the price lists is the Imperial seer of 80 tolahs, as mentioned above.

806. STAMPING WEIGHTS AND MEASURES.—A small fee is collected from shopkeepers, grain merchants, and others wishing to have their weights and measures tested and stamped in proof of their being of a fixed standard. The standards for this purpose for each locality (generally a talook) have been arrived at by local usage, sanctioned by the Collectors. Standard weights have been supplied to Collectors from the Public Works Workshop. For testing measures a number of test-glasses have been obtained from England and distributed to districts. Each Collector is supplied with two sets and each stamping establishment with one set. Tahsildars have been required to send a measure to head-quarters to be tested and corrected and returned to the talook cutcherry to be kept there as a standard. The process is to correct the weights and measures which are brought so as to make them conform to this standard, and then stamp them. Multiples are recognized but not other varieties from the standard. A uniform rate of fee is now charged in each district varying from 4 pies to 2 annas for each measure tested and stamped, and from the proceeds a small establishment is maintained for doing the work. This charge does not include what is paid to the smith who impresses the stamp. The fee is not collected under any law, but the benefit of the arrangement is appreciated by the people, and many come of their own accord from long distances to have their measures tested and stamped; the object being to establish confidence with their customers. The receipts and charges up to 1873 were assigned to the general revenues, on the understanding however that the charges should never exceed the receipts, but they were then transferred to Provincial Funds. The receipts and charges for six recent years are given in the foot-note.^[10] The law relating to weights and measures is shown in Vol. II, App. LIV, under that title.

807. MISCELLANEOUS.—Terms indicating direction must be mentioned, to notice the native points of the compass. These are on land eight in number, without further sub-division, as shown below.^[1] The regent deities and their distinctive signs are attached to each. The Tamul terms are all Dravidian. The sense of direction by the sun is always present in the minds of the native population, and in conversation is much more frequently referred to than in Europe. The fishermen and native navigators of this Presidency use sixteen points of the compass with Malay technical names.

ECCLESIASTICAL.

808. INTRODUCTION.—The Government maintains for Protestant officials an ecclesiastical establishment proper, at the head of which is the Bishop of Madras, and the services of this establishment are extended to non-official Europeans and others resident within the Presidency. The Government also pays the Roman Catholic Bishop of Madras for a purpose hereafter mentioned, and pays or subsidizes Roman Catholic priests and Presbyterian and Wesleyan ministers as chaplains to the troops in military stations. It has the same relations with missionaries and ministers of various denominations in stations where there are no suitable chaplains. With the missionary Bishops at Tuticorin and Palamcottah, and with the Bishop of Travancore and Cochin, it has communications, but does not contribute to their emoluments. The Government builds, furnishes, and repairs churches, both Catholic and Protestant, for the use of soldiers, or pays for their sittings. Quarterly returns of baptisms and burials are collected from dissenting ministers, and also returns of marriages from those who are legally authorized to solemnize marriages.

809. PROTESTANT ESTABLISHMENTS IN THE PRESIDENCY.—By the Statute 53 Geo. III, Chap. 155 (1812-13), provision was made for the appointment of a single Bishop for the whole of India; and the Sovereign was empowered to grant to the Bishop such ecclesiastical jurisdiction and the exercise of such episcopal functions as His Majesty might think necessary for the administration of holy ceremonies and for the superintendence and good government of the ministers of the Church Establishment. Under the authority of this Statute letters-patent for the Bishopric of Calcutta were issued under date the 2nd of May 1814, establishing the See of Calcutta subordinate to the Archi-episcopal See of Canterbury, and constituting the Archdeaconry of Calcutta. The Statutes 3 and 4, Will. IV, Chap. 85 (1833), subsequently empowered the Sovereign to found and constitute the Bishoprics of Madras and Bombay, and constituted the Bishop of Calcutta Metropolitan Bishop in India. On 13th June 1835 the Bishopric of Madras was accordingly constituted by letters-patent, leaving the metropolitan jurisdiction only with the Bishop of Calcutta. The jurisdiction of the Bishop of Calcutta has also been further curtailed by the subsequent formation of the Bishoprics of Lahore and Rangoon. The Statutes 3 and 4, Will. IV, Chap. 85, also provided for the appointment of two Chaplains of the Church of Scotland to be inducted and ordained by the Presbytery of Edinburgh according to the forms and solemnities used in the Church of Scotland, and to be subject to the spiritual and ecclesiastical jurisdiction in all things of the Presbytery of Edinburgh. The law specially affecting the Church

of England is found in the following enactments:—(1) Bishop—53 Geo. III, c. 155, s. 53 (A.D. 1812-13); an Act for continuing in the East India Company for a further term the possession of the British territories in India, together with certain exclusive privileges; for establishing further regulations for the government of the said territories, and the better administration of justice within the same, and for regulating the trade to and from the places within the limits of the said Company's charter—3 and 4 Wm. IV, c. 85, ss. 89-100 (A.D. 1833); an Act for effecting an arrangement with the East India Company, and for the better government of His Majesty's Indian territories, till the thirtieth day of April 1854—5 and 6 Vict., c. 119 (A.D. 1842); an Act to enable Her Majesty to grant furlough allowances to the Bishops of Calcutta, Madras, and Bombay who shall return to Europe for a limited period after residing in India a sufficient time to entitle them to the highest scale of pension—15 and 16 Vict., c. 52, s. 2 (A.D. 1852); an Act to enable Colonial and other Bishops to perform certain Episcopal functions, under commission from Bishops of England and Ireland—16 and 17 Vict., c. 49 (A.D. 1853); an Act to extend the provisions of an Act of the fifteenth and sixteenth years of Her present Majesty, intituled "An Act to enable Colonial and other Bishops to perform certain Episcopal functions, under commission from Bishops of England and Ireland"—34 and 35 Vict., c. 62 (A.D. 1871); an Act to enable Her Majesty to make regulations relative to the leave of absence of Indian Bishops on furlough and medical certificates—37 and 38 Vict., c. 77, ss. 7, 8, 12, 13 (A.D. 1874); an Act respecting Colonial and certain other clergy—43 Vict., c. 3, s. 3 (A.D. 1880); an Act to amend the Law relating to the salaries and allowances of certain officers in India; and for other purposes relating thereto. (2) Archdeacon—53 Geo. III, c. 155, ss. 49, 50, 89 (A.D. 1812-13), (see above)—4 Geo. IV, c. 71, ss. 3 and 4 (A.D. 1823); an Act for defraying the charge of retiring pay, pensions, and other expenses of that nature of His Majesty's forces serving in India; for establishing the pensions of the Bishop, Archdeacons, and Judges; for regulating ordinations; and for establishing a Court of Judicature at Bombay—3 and 4 Wm. IV, c. 85, ss. 98-101 (A.D. 1833), (see above)—43 Vict., c. 3, s. 3 (A.D. 1880), (see above). (3) Chaplains—4 Geo. IV, c. 71, s. 4 (A.D. 1823), (see above). (4) Church of England Clergy generally—59 Geo. III, c. 60, s. 1 (A.D. 1819); an Act to permit the Archbishops of Canterbury and York and the Bishop of London for the time being to admit persons into Holy Orders specially for the Colonies—37 and 38 Vict., c. 77 (A.D. 1874), (see above)—Act XV of 1872, ss. 5, 10, 11, 28 and 29, The Indian Christian Marriage Act. (5) Church of Scotland Clergy generally—3 and 4 Wm. IV, c. 85, s. 102, (see above)—Act XV of 1872, ss. 3, 5, 31, The Indian Christian Marriage Act. The details of the law are given under the heads of "Archbishop," "Bishop," and "Archdeacon" in Vol. II, App. LIV.

810. The Madras Ecclesiastical establishment proper consists of a Bishop,^[1] an Archdeacon (who must be one of the Chaplains and is appointed by the Bishop),^[2] 40 Chaplains (including the Archdeacon), and a Registrar. The Bishop superintends the spiritual work of the diocese; holds confirmations; ordains, licenses, and exercises jurisdiction over the clergy; visits all the stations at which clergy are located and many of the outstations, as a rule once in three years; inspects the registers and other church books; recommends to Government the appointments and removal of Chaplains; reports upon the advisability or otherwise of proposals for new churches, improvements in churches, changes in

[¹] LIST OF PROTESTANT BISHOPS.—Bishops of Madras.—Rt. Rev. Daniel Corrie, D.D., consecrated 14th June 1835, installed at Madras 26th October 1835, died at Madras 5th February 1837. Rt. Rev. John George Trevor Spencer, D.D., consecrated 19th November 1837, installed 4th November 1838, Letters Patent dated 4th November 1837, resigned 1849. Rt. Rev. Thomas Dealtry, D.D., consecrated at Lambeth 2nd December 1849, installed at Madras 2nd February 1850, died at Madras 6th March 1861. Rt. Rev. Frederick Gell, D.D., consecrated 29th June 1861, installed 27th November 1861. (2) Missionary Bishops.—Rt. Rev. Robert Caldwell, D.D., LL.D., consecrated 11th March 1877. Rt. Rev. Edward Sargent, D.D., consecrated 11th March 1877. (3) Travancore and Cochin.—Rt. Rev. J. M. Speechly, D.D., 4 25th July 1879, installed at Cottaayam 1st February 1880.

[²] LIST OF ARCHDEACONS OF MADRAS.—Archdeacon Thomas Robinson appointed 7th May 1826, retired 7th January 1836. Archdeacon Henry Harper appointed 11th January 1836, retired 24th August 1846. Archdeacon Vincent Shortland appointed 1st November 1846, retired 10th December 1860. Archdeacon Thomas Dealtry appointed 1st December 1861, retired 2nd May 1871. Archdeacon John Gorton appointed 4th August 1871, retired 8th July 1876. Archdeacon C. R. Urury appointed 8th March 1876, retired 11th September 1881. Archdeacon G. Warlow appointed 11th September 1881, died 24th January 1884. Archdeacon J. F. Browne appointed 2nd February 1884.

any of the ecclesiastical arrangements. The Archdeacon attends more particularly to the details of church establishments, church furniture, cemeteries, repairs, budgets; and communicates with the Government on these subjects. No special pension attaches to the office of Archdeacon, the ordinary Chaplain's pension only being granted to holders of the office. The Chaplains are divided into two classes, senior and junior, the proportion of senior to junior Chaplains being 15 to 25. Promotion to the senior class is attained upon the completion of 10 years' service, or earlier if the number of senior chaplaincies at any time falls below 15. Chaplains are required to serve 20 years for a full pension. Seventeen of those years must have been spent in actual service. Smaller pensions are granted on retirement enforced through sickness. Retirement is compulsory on the completion of 25 years. One of the Chaplains is appointed by the Bishop to be his Domestic Chaplain. The others are appointed by the Government to the charge of stations, 33 in number, counting each sub-division of a station as one; as shown in Vol. II, App. LXXIV. Every Chaplain at a station in which there are European troops visits the schools and hospitals under stated rules. To several stations are attached outstations; these are visited periodically by the Chaplain of the station.

811. Besides the Chaplains there are other European and a few Eurasian clergymen, who are either in receipt of grants-in-aid from Government, or are at any rate under the spiritual direction of the Bishop of Madras. Some of these minister to European congregations who are not entitled to the services of a resident Government Chaplain, and some are missionaries. The former receive their salaries either from one of two societies for providing additional clergy, or from local contributions, or from both; the Government in all cases allowing a grant-in-aid. A list of the stations served by this class is given in Vol. II, App. LXXIV. The missionaries, as such, are not connected with Government, but are wholly maintained by the various missionary societies, especially the Society for the Propagation of the Gospel, and the Church Missionary Society.^[3] For the stations, see the lists in

[3] SKETCH HISTORY OF PROTESTANT MISSIONS IN SOUTHERN INDIA.—*Introduction*.—An account will here be given of each principal mission in the order of their historical origin, with some concluding remarks on the same subject viewed geographically. (2) MISSIONS VIEWED CHRONOLOGICALLY.—*The Danish Mission*.—The first mission in Southern India, and in fact in any part of India was the Danish one at Tranquebar. The first missionaries were Ziegenbalg and Plutschau, who came out in 1705. They met with little sympathy, and were much opposed by the Governor, who finally imprisoned Ziegenbalg for four months. Soon afterwards three new missionaries came out, who also opposed their predecessors. In spite of these drawbacks the mission obtained 160 converts in three years and a half. The first contribution made to Indian Missions from England was by the Propagation Society (established in 1701) in 1709, the amount of the contribution being £20, with some books. In 1711 Plutschau went home to lay the state of matters before the King of Denmark, who after this took some interest in the affairs of the mission. In 1714 Ziegenbalg went home and afterwards proceeded to England, where he was received with enthusiasm. He returned to India in 1716, and died in 1719. The mission was now left in the hands of Schultze, Dahl, and Keisteomaecher, by the first of whom, the translation of the Bible into Tamil, originally commenced by Ziegenbalg, was completed in 1725. The Madras Government opened schools at Tranquebar, and the missionaries were placed in charge of them. By the end of 20 years the number of converts was 678. In 1726 Schultze established a mission in the town of Madras, afterwards taken over by the Society for the Promotion of Christian Knowledge; which in 1730 sent Mr. Sartorius to take charge. Medical missionaries were also sent out in 1732, whose influence seems to have been great. Mission stations were now formed at Negapatam, Madras, Fort St. David, and Cuddalore in 1737. Sartorius died in 1738 and was succeeded in 1740 by Kiernander, who remained at his post throughout the siege by the French in 1746. During the next 10 years the converts increased by 3,812. When the French captured Madras in 1746, the mission-house was destroyed, and Fabricius who was in charge of the mission, retired to Poolcat. After the return of the English to Fort St. George in 1748, the buildings of the Roman Catholic Mission at Vepery were presented to the Protestant mission. In July 1750 the great missionary Schwartz came out. At the end of 50 years' work the result was 11,000 converts. In 1758 the French again besieged Fort St. George, and occupied Black Town. Fabricius then appealed to Lally, who generously protected the mission. In 1760—62, churches were erected at Trichinopoly, Cuddalore, and Pollam. Schwartz settled at Tanjore in 1776 and founded a mission there, and built a church in 1779. His personal influence with all classes was so great that in 1779 the Governor of Madras sent him on a political mission to Hyder Ally. During Hyder's subsequent devastations, complete confidence was placed in Schwartz by the natives, and Hyder respected him so much as to issue general orders to his army to allow Schwartz to proceed wherever he wished. Twice when the Fort of Tanjore was threatened with famine, Schwartz by his excellent management relieved it. Afterwards when the British Government took temporary charge of the Tanjore Kingdom, Schwartz was appointed a member of the Committee of Inspection at the urgent request of the Resident. At the death of the Tanjore Rajah, Schwartz was appointed guardian to his adopted son, and also placed in charge of the Court of Justice at Tanjore. He died in 1799 after forty-eight years of uninterrupted work. About this time the Danish Mission became involved in pecuniary difficulties, as they could not communicate directly with Denmark in consequence of the war in Europe; they were however liberally helped by the Society for the Promotion of Christian Knowledge. In 1814 Schnarre and Rhenius came out, the latter to Madras. In 1816 there were 500 converts in Trichinopoly under the charge of Pohl. All these missions were finally transferred to the Society for the Propagation of the Gospel, and the Leipzig Lutheran Mission. (3) *Society for the Propagation of the Gospel in Foreign Parts*.—The S.P.G.F.P. was organised in England in June 1701, and at the same time was incorporated by charter, by King William the Third, for the receiving, managing, and disposing of funds contributed for the religious instruction of the Queen's subjects beyond the seas; for the maintenance of clergymen in the plantations, colonies, and factories of Great Britain; and for the propagation of the Gospel in those parts. In fact it was to provide for the ministrations of the Church of England in the British Colonies, and to propagate the Gospel among the native inhabitants of those countries. The Society began its labours in India about 1720, through the instrumentality of some of the German missionaries who frequently visited Madras from Tranquebar, and the co-operation of Lewis Stephenson and other chaplains, as well as Mr. Pitt, the then Governor of Madras. The factory of Madras was distin-

Vol. II, App. LXXIV. Native clergymen, Tamul, Teloogoo and Malayalam, constitute a third and continually growing class. The Bishop is assisted in the superintendence of missions and the native church by Bishops (now two, located at Tuticorin and Palamcottah) consecrated for the purpose. The affairs of the native

guished in having the first Protestant church built in it by Mr. Streynsham Master. Schultze was the first missionary appointed and supported by the S.P.C.K. in 1216 or 1728. In 1818 the S.P.G. voted £5,000; and in the same year took charge of the direct missionary operations hitherto in the hands of the S.P.C.K. and managed by foreign missionaries chiefly sent out from the college at Copenhagen. Some of the latter, such as Schwartz, Fabricius, Gericke, and others, were men of great eminence. The Diocesan Committee was formed by Bishop Heber in 1822 or 1823. (4) *The London Missionary Society.*—The first station occupied by the London Mission in the Madras Presidency was the city of Madras in 1804, in charge of the Rev. W. Loveless, and afterwards, in 1805, Vizagapatam, in charge of the Rev. Messrs. Cran and Desgranges. In 1806 work was commenced in Travancore by Rev. W. T. Ringletane; and in 1810 in Bellary by Rev. John Hands. Bangalore was occupied by Rev. Messrs. Laidler and Forbes in 1820; Cuddapah by Rev. W. Howell in 1822; Salem by Rev. Henry Crisp in 1827; Coimbatore by Rev. W. B. Addis in 1830; Vizianagram by Rev. W. Dawson in 1852; and Nundial by Rev. R. D. Johnston in 1855. The head-quarters of the Nundial Mission were transferred to Gooty in 1881 by Rev. W. W. Stephenson. At all these stations, in addition to preaching, much attention has been given to the education of the young of both sexes. Many of the missionaries have also aided materially in the translation of the Holy Scriptures, and in other literary work. The total number of converts at all the stations is now 64,543. (5) *The Church Missionary Society.*—The Church Missionary Society sent its first missionaries to South India in 1814. Two missionaries were sent to Tinnevely, at the request of the Rev. Mr. Hough, Chaplain of Palamcottah, in the year 1820. Mission work in the kingdom of Travancore was commenced in 1816, and in the Kistna and Godavery districts in the year 1841. All of these missions have been maintained until the present time. Of late years a new mission has been started amongst the Koois, a branch of the Khond nation. At present in the South Indian Mission, excluding the diocese of Travancore and Cochin, there are, connected with the society, European clergymen, 20; native clergy, 76; the majority of whom are paid by and are under the direction of the Native Church Councils, bodies to whom certain powers of self-government are given, and to whom the society gives a grant-in-aid to meet the expenses of the several pastorates under them. The number of Christians is 59,955, of catechumens 14,254. There are in the mission two second-grade colleges, six high schools, and a large number of primary schools. In each large station, there is a boarding school for boys and girls. The total number of scholars in the Society's schools is 20,903. The Native Christians raise for church expenses and charitable objects about Rs. 41,000 a year. In the diocese of Travancore and Cochin there are eight European missionaries, 16 native clergymen, 18,539 Christians, and 1,308 catechumens. The scholars in the schools amount to 5,404. (6) *The Wesleyan Missionary Society.*—The first Wesleyan missionary was sent to Madras in 1818 from Ceylon, where Wesleyan Missions had been established for some years. In 1821 a chapel was built in Madras, and the same year Negapatam, as being on the highway between Ceylon and Madras, was fixed upon as a second centre. The work of the mission has from that time been carried on in and around these two places; that is to say in Madras and the Chingleput district in the north, and in Negapatam and the Tanjore district in the south. To these was added in 1847 the town and neighbourhood of Trichinopoly, and in more recent years a part of the Coimbatore district with Caroor as a centre. During the first 20 years the missionaries devoted themselves almost exclusively to preaching to the English soldiers and to the European and Eurasian communities, but as their numbers increased they devoted more of their time to vernacular preaching and to elementary education. In 1851 a change of policy with reference to their educational work took place, and many of the vernacular schools were closed to make way for large central institutions designed to give English education. The chief operations of the mission consist now in "a" English preaching, "b" vernacular evangelistic and pastoral work, "c" English and vernacular schools for boys and girls, "d" an industrial orphanage at Caroor, and "e" medical and zenana work in Madras and elsewhere. The following are the statistics of the mission:—number of missionaries, both Europeans and natives, 19; number of catechists, 36; number of school teachers, 249; number of scholars, 5,166; number of Christians, 2,335; grant from England (in 1884) Rs. 86,107. (7) *The American Madura Mission.*—The American Madura Mission was established in 1834 and is the youngest of three missions established in India and Ceylon by the American Board. The Rev. Messrs. Hoxington and Poor were sent by the elder mission at Jaffna, and through their efforts a footing was gained in Madura and the work was thoroughly inaugurated. Since then the work has been continuously and successfully conducted to the present, when the Christian community numbers 11,616 souls, of whom 2,908 are communicants. More than one hundred missionaries, male and female, have joined the mission from America during its history. Of these twenty-five are now engaged in the work. These are aided by 377 native agents, of whom eighteen are ordained. The educational work of the mission is represented by 200 schools in which about 5,000 boys and girls are being educated. The highest of these institutions is that at Pasoomullay, which is a second-class college. (8) *The Basel Evangelical Mission.*—This Society has its name from the city of Basel in Switzerland and was founded in the year 1815. In 1834 the first missionaries were sent out to India, among them the famous Hehlich. They arrived in Mangalore in South Canara on the 30th October 1834. The mission was reinforced in 1836 by four and in 1839 by five new arrivals. Besides Mangalore they began work at Honore in North Canara, at Dharwar in the South Mahratta country, and at Tellicherry in Malabar; in three different languages, viz. Tooloo, Canarese, and Malayalam. In 1846 the Neilgherry district was also taken up by this mission and in 1853 the country of Coorg. There are now 15 headquarters or stations, and in connection with these there are about nearly 100 villages in which converts reside. Special branches of this mission are occupied industrially, viz., in printing, weaving and tile-manufacture. These are at Mangalore, Cannanore, and Calicut. This last part of the work is done by a separate staff of 17 lay missionaries, whilst in the ecclesiastical, in itinerating and school work there are employed 46 missionaries and 73 catechists and native preachers. The converts number 6,500. In schools there are 2,700. (9) *The American Baptist Teloogoo Mission.*—The Rev. Samuel S. Day opened work in the city of Madras in 1836 but removed to Nellore in 1840. Work in the Nellore district was for many years from 1849 carried on by the Rev. L. Jewett, D.D. The Rev. J. G. Clough opened work in Ongole in 1866. The mission now has 14 principal stations, 20 missionaries, and 20,000 communicants. The larger part of the converts has come from the Nellore and the Kistna districts. The principal schools are a high school in Ongole, a theological seminary in Ramaputnam, and an industrial school in Nellore. (10) *The Free Church of Scotland Mission.*—The Free Church of Scotland Mission was commenced by the General Assembly in 1837, and at the disruption in 1843 continued in connection with the section of the Church known as the Free Church of Scotland. Its work has been distinctively educational. The Rev. John Anderson, the first missionary, founded in 1837 the "General Assembly's Institution," which was afterwards known as "the Free Church Mission Institution," and since 1876, when other missions took a share in its support and management, as "The Madras Christian College." The first associate of Mr. Anderson was the Rev. Robert Johnstone, who died in 1853. Mr. Anderson continued at the head of the mission from 1837 till his death in 1866, when he was succeeded by the Rev. J. Braidwood, who retired in 1860. After a brief tenure of the office, the Rev. A. B. Campbell was succeeded in 1868 by the Rev. William Miller who has continued since then to be Principal of the College. In 1867 the management of the mission outside the college was entrusted to the Rev. W. Stevenson as Secretary; an office which he held till his retirement in 1884. At an early period in its history the mission opened several branch schools for boys, of all of which, as well as of the college, the combination of religious with secular instruction has always been the most marked characteristic. In 1843 it commenced the work of South Indian female education. In 1884 it had 11 schools for boys and 17 for girls, at which it was educating more than 1,400 of the former and about 1,600 of the latter. This is exclusive of the Christian College at which there were 1,000 pupils in the school department and 450

churches, in matters not spiritual, are managed by councils composed chiefly of native clergy and laity, and by the committees of the missionary societies. The native church councils are of two kinds; the smaller or district councils, and the larger or provincial.

under-graduates in the college. The Christian College is the largest affiliated institution of the Madras University and takes a leading place in influencing all higher education throughout the south of India. Besides its educational work the mission has several native congregations, and, besides the professors and Christian teachers in the college, it employed in 1884 five European and more than seventy Native Christian agents as ordained clergymen, preachers, catechists, and teachers. (11) *The Leipzig Evangelical Lutheran Mission*.—The Danish Mission has been continued by the former Dresden now Evangelical Lutheran Mission Society since 1841. This Society was removed from Dresden to Leipzig in 1846 for the purpose of enabling young mission candidates to hear theological lectures. (12) *The American Evangelical Lutheran Mission*.—This mission was founded in 1843 by the Rev. C. F. Heyer, and was handed over to the Foreign Missionary Society of the Lutheran Church in 1843. Mission stations were established at Goontoor and Pulnaud, and the work of the mission progressed so favourably that in 1851 the North German Missionary Society transferred their mission at Rajahmundry to its care. In 1859 a new station was established at Samulcottah, so that the mission then numbered four stations. Owing to the civil war in America the resources of the mission were much tried so that for want of funds to support missionaries the whole of the four mission stations were at the end of the year 1866 placed under the charge of the Rev. Unangst. The prospect of new missionaries at this time was slender, and proposals were made to transfer the Rajahmundry and Samulcottah mission stations to the care and possession of the Church Missionary Society; but the Pennsylvania Synod protested against this transfer and the Rev. C. F. Heyer, who had since retired, was again sent out in December 1869 to assume charge of the stations till assistance could be procured. Shortly after this he was relieved and returning to America died in 1873, aged 81 years. In 1871 the Rev. Unangst returned to America, leaving the mission work in charge of Mr. Cully, an evangelist of the mission. While in America he visited the Synods and a number of congregations and Sunday schools, and aroused an interest in the mission. A conference was constituted for the transaction of business, and Mr. Cully was the first who was ordained by it to the ministry. Mr. Rowe, another missionary who was appointed in 1874, was called the "children's missionary," his work being in connection with Sunday schools. The Women's Missionary Society of the Lutheran Church resolved to assume the support and expense of senana work and of the girls' schools in Goontoor, and for this purpose appointed Miss R. M. Boggs as their missionary. (13) *The Arcot Mission of the Reformed Church in America*.—The following are the statistics and facts. Founded in the North Arcot district in 1851 by Rev. H. M. Scudder, Sr., D.D., M.D. 1852—Rev. Messrs. William W. Scudder, M.A., and Joseph Scudder, M.A., arrived; a medical dispensary was opened in Wallajahpett; stations occupied were Vellore, Chittore, and Arnee; the Arcot seminary for boys, and the female seminary, both boarding schools, were established; "Spiritual Teaching" in Tamil and Telooqoo and "Jewel Mine of Salvation" in Tamil were published. 1855—Rev. E. C. Scudder, Sr., M.A., and Rev. J. W. Soudder, M.A., arrived; Christians increased from 150 to 850. 1856—Coonoor occupied; church built in Vellore; "Sweet Savours of Divine Truth" in Tamil published; Christians 459. 1857—Church built in Chittore; Christians 510. 1859—Rev. J. Mayon, M.A., joined; Pulmanair occupied; churches built in Arnee and Coonoor; Rev. Andrew Sawyer, first native pastor, ordained; first village came over to Christianity; Christians 579; Rev. Joseph Scudder, M.A., retired. 1860—Rev. J. Chamberlain, M.A., M.D., and S. D. Scudder, Esq., M.A., M.D., arrived; Christians 612. 1861—Rev. John Scudder, M.A., M.D., arrived; Christians 796. 1862—S. D. Scudder, M.D., was ordained to the Gospel ministry; two Brahmins were baptised; Christians 828. 1862—Three villages joined; Madanapally was occupied; preparandi school for Hindoo converts was founded; Christians 1,021. 1864—Rev. H. M. Scudder, Sr., D.D., M.D., retired; three villages joined; Christians 1,124. 1865—"The Bazaar Book, or Vernacular Preacher's Companion" in Tamil was published; Christians 1,124. 1866—Arcot dispensary opened in Ranipett; female seminary building at Chittore completed; eight villages joined; Christians 1,525. 1867—Three villages joined; Christians 1,723. 1868—Arcot seminary building at Vellore completed; "Sahodara Sangam," or Society of Brethren, to aid indigent Christians, was founded; "Jewel Mine of Salvation" in Telooqoo published; thirteen villages joined; Christians 2,094. 1869—Rev. J. Mayon, M.A., retired; translation into Tamil of the Heidelberg Catechism published; three villages joined; Christians 2,164. 1870—Misses M. Mandeville and Josephine Chapin joined; four villages added; Christians 2,274. 1871—Four villages joined; Christians 2,478. 1872—Rev. Messrs. W. W. Scudder, D.D., and S. D. Scudder, M.D., retired; Rev. E. J. Hieren joined; two Hindoo girls' schools opened in Vellore; thirteen villages added; Christians 3,250. 1873—two villages added; Christians 3,725. 1874—Miss Chapin retired; H. M. Scudder, Jr., M.D., and Rev. J. H. Wyckoff, M.A., joined; Christians 3,523. 1875—Lying-in hospital opened at Ranipett; Christians 2,452. 1876—Rev. E. C. Scudder, Sr., M.A., retired; Tindivanam occupied; Christians 2,574. 1877—Rev. E. J. Hieren, M.A., retired; Christians 4,398. 1878—Branch dispensary opened in Wallajahpett; Christians 5,803. 1879—Christians 5,586. 1880—H. M. Scudder, Jr., M.D., retired; also Miss M. Mandeville; Christians 5,100. 1881—Rev. J. W. Cooklin, M.A., joined; Native Pastors' Aid Society founded; Christians 5,277. 1882—Rev. L. Hekins, M.A., M.D., and Rev. E. C. Scudder, Jr., M.A., joined; Christians 5,371. 1883—Miss M. H. Scudder joined; Christians 5,405. Statistics at close of 1883.—Missionaries 7, assistant missionaries 6, native ministers 4, catechists 26, assistant catechists 16, masters in Anglo-vernacular schools 30, readers and schoolmasters 28, village schoolmasters 19, schoolmistresses 11, colporteurs 6, female Bible readers 7, principal stations 8, village outstations 80, schools 83, boys in schools 1,314, girls in schools 608, communicants 1,625, total of Christian adherents 5,405. (14) *The Strict Baptist Mission*.—This mission was established in Madras in December 1866 by H. T. Doll, missionary and superintendent of the mission. It has ten centres of evangelical work; one in the Madras District, two in the Chingleput District, and seven in the Tinnevely District. In December 1881 the mission was established in the Tinnevely District; but prior to that time there were Baptists of some 30 years' standing, or more, in certain parts of that district. The following are the statistics:—Missionaries 2 males and 1 female, 3 native ministers, 1 native preacher, and 14 teachers, senana woman 1, churches 7, communicants 210, adherents 250, Hindoo caste girls' school 1, Hindoo caste boys' school 1, out-caste schools 6. There are also 3 indigenous English Strict Baptist churches. (15) *The Hermannsburg Evangelical Lutheran Mission*.—In the beginning of 1866 a missionary named H. Mylins, sent by the Hermannsburg Mission from the once kingdom of Hanover, joined the southern part of the Nellore District for the purpose of inaugurating a mission. After some difficulty he procured two pieces of land, one at Naidoopett, and one at Goodoor. Soon after, three more missionaries, Messrs. Dahl, Petersen, and Brunotte, arrived. The first mission-house was built in 1867. The then Collector of Nellore, the late Mr. Bowwell, was instrumental in extending the mission. The mission has since been gradually increasing and now has seven stations in the Nellore District, three in North Arcot and one in Ouddapah. About 1,100 Hindoos have been baptised up to the present date. (16) *The Canadian Baptist Telooqoo Mission*.—The Canadian Baptist Telooqoo Mission commenced operations in 1874, when a station was opened at Oocanada in the Godavary District. During the next year a station was opened at Bimlipatam. At the close of the year 1884 there were six mission stations, eight missionaries and their wives, besides one senana lady worker. The number of church members was 1,717. (17) *Missions viewed by Districts*.—The following paragraphs give some information under this head. (18) *North and South Arcot and Salem Districts*.—The first mission in Arcot was founded at Ouddalore in 1737 at the instigation of Sartorius. Twenty years before this, in 1717 Ziegenbalg had commenced a school there. The mission was finally transferred to the Propagation Society, and flourished. More extensive operations were undertaken by the American Reformed Protestant Dutch Church Mission under Dr. Henry Scudder, in 1860. He established a mission at Arcot and was joined by other members of his family. In 1855 the Propagation Society transferred to them the Vellore and Chittore missions. In 1873, 34 villages near Madanapally simultaneously embraced Christianity. The Danish Lutheran Society of Copenhagen commenced a mission in this district

812. At every station where there is Government church property two gentlemen appointed by the Government to be Lay Trustees form, with the Chaplain as president, a church committee. The duties of Lay Trustees resemble in some respects those of churchwardens. They also conduct Divine service in the absence of the Chaplain. The churches for European congregations are, with rare exceptions, the property of Government. One of the churches in Madras is the cathedral of the Madras Diocese. Two Chaplains are assigned to it. But there is no chapter; nor are there any distinctively cathedral officers.

813. On the 31st of March 1884 the total number of Protestant clergymen in the Diocese of Madras was 232, of whom 38 were Government Chaplains; 25 were Europeans or Eurasians employed in education, or ministering to English congregations, or retired; 2 were Bishops superintending parts of the native church; 40 were European and Eurasian missionaries; 124 were native pastors; and 3 were native clergymen otherwise employed, or retired. By the last returns the number of European and Eurasian Christian members of the Church of England was 23,587. The returns from the mission stations of the two principal missionary societies are given below. [4]

in 1861, and in the same year the Church of Scotland opened one at Vellore. In Salem the London Missionary Society had at a recent date 14 congregations; this mission was founded in 1827. At a recent date these districts contained 4,536 converts, and 77 schools with 1,972 pupils. (19) *Cuddapah, Kurnool, and Nellore Districts.*—These districts contained at a recent date 13,798 Christians, mostly of low caste tribes. The Propagation Society Mission commenced in 1817 and the London Society Mission in 1822. The American Baptist Mission began operations in 1840. This mission has six theological and training schools. The Free Church Mission which was started in Nellore in 1840 is chiefly educational. The Hermannsburg Lutheran Society of Hanover has six stations in Nellore, established since 1865. (20) *Kistna, Godavery, Visagapatam and Ganjam.*—Kistna was occupied by a German Lutheran Society of America in 1842, which started another mission at Pulnaud soon after. The Church Missionary Society was started in 1841 by Noble, Fox, and Sharkey. In 1838 a mission was started in Godavery, called the Godavery Delta Mission, which is quite independent of any external help. At Rajahmundry the American Evangelical Lutherans have several missions. The London Mission Society in Visagapatam was started in 1805 by Cran and Desgranges. This mission has been much engaged in the translation of the Scriptures into Telugoo. The General Baptist Society started a mission at Berhampore in Ganjam in 1837. (21) *Bellary and Mysore.*—The missions in Bellary and Mysore are chiefly among the Canarese. The London Society established a mission at Bellary in 1810, by means of the Rev. John Hands. Another mission was founded at Bangalore in 1820. The Wesleyan Mysore Missions were started 60 years ago, by Messrs. Hoole and Mowat. The oldest mission in Mysore is that of the Propagation Society, founded at Bangalore in 1817. In 1871 this mission had no European agent on the spot, an instance of self-government in the native church. (22) *North Travancore and Cochin.*—North Travancore and Cochin has been inhabited by Syrian Christians from a remote period. At the beginning of the sixteenth century, Vasco da Gama found these Christians scarcely subject to any Hindoo king, but with petty rulers of their own. They were afterwards much persecuted by the Portuguese. In 1816 the Church Missionary Society sent three missionaries to Travancore, at the request of Colonel Munro, the Resident. These missionaries formed a council in conjunction with the Metran or Syrian Bishop, for the management of all the Syrian churches. Matters were conducted in this manner without any difficulty till 1838, when objections arose and the union was dissolved, the endowment of the previously founded Syrian college being divided between the Metran and the Society, to be used for educating Native Christians. (23) *South Travancore.*—The mission in South Travancore was commenced in 1806 by Ringletaube of the London Missionary Society. He left the place in 1815, and was never heard of again. In 1818 his place was taken by Mead and Kuill, who lived at Nagarcoil. (24) *Tinnevely.*—This district contains a large number of Native Christians. The mission was originally an outstation from Tranquebar, and in 1771 a Dutch Christian went to reside at Palamcottah. Jenicke joined the mission in 1791, and carried on the work by continual visitations. During an outbreak of the Poligars, the Christians were exposed to much persecution, but afterwards Gericke travelled through the district, and collected the congregations again. In 1830, 10 missionary districts were formed. In 1829 these missions were surrendered by the Christian Knowledge Society to the Propagation Society, which appointed Rosen to manage them. In 1835 a controversy rose as to whether ordination by an English Bishop was indispensable in the case of catechists, in consequence of which Rhenius and the other German Missionaries left the Society and formed themselves into the German Evangelical Mission. Bishop Corrie tried to adjust the difference, but failed. Rhenius died in 1838, and in 1839 half the separated congregations reunited with the Church Mission, and the remainder in 1840. The Propagation Society meanwhile flourished, one of the most eminent of its members being the Rev. now Bishop Caldwell. A schism now arose among the Shaunar converts which resulted in the formation of the "Hindoo Church of the Lord Jesus." They have rejected everything which appears to them to have a European origin, amongst others, infant baptism, the ordained minister, and the use of wine at the Lord's supper, the unfermented juice of grapes being substituted; they also observe Saturday as the Sabbath, instead of Sunday. (25) *Madura.*—The work in this district was originally commenced by the Tranquebar Danish Missionaries. It was afterwards nominally under the Christian Knowledge Society, but was then again transferred to the Propagation Society. The most important missions in this district, are those of the American Board, which commenced operations in 1834. A seminary or theological college was founded in 1842. There are now 11 central stations in this district.

[4] STATISTICS OF MISSION STATIONS.

Society for the Propagation of the Gospel.

Number of villages in which there are Christians.	968	Number of Christians	43,363
Do. of clergy	60	Catechumens	16,788
Do. of catechists	188	Grant from England (which does not include	
Other agents	285	special funds)	Rs. 1,32,500
Baptisms during the year	2,575					

Church Missionary Society.

Number of villages in which there are Christians.	1,148	Number of Christians	49,942

Do. (women)		special funds)	Rs. 1,90,049-8-0

814. CATHOLIC ESTABLISHMENTS IN THE PRESIDENCY.—The Catholic establishments of Southern India are to be classed as missionary in the sense of not being State establishments. Their history is briefly sketched in the foot-notes [5] and [6].

[5] **SKETCH HISTORY OF CATHOLIC SOUTH INDIAN MISSIONS GENERALLY.**—*Saint Thomas in India.*—The origin of Christianity in India is obscure. The tradition generally accepted by Catholics connects it with Saint Thomas the Apostle, who is said to have preached on the east coast, and finally to have been murdered at the Little Mount near Madras. Many years later the Patriarch of Babylon hearing of the desolate state of the Church in India, sent out bishops of the Syrian rite, the existence of which to the present day in the Malayalam country is thus explained. About 486 A.D., Nestorianism first made its appearance in Malabar. Other authorities consider that there is no evidence of Saint Thomas' presence in India, and maintain that the first Indian Christians were Manicheans or Gnostics. 2. *The first authentic mission.*—The first Roman Catholic mission arrived in India from Portugal in 1500, and was composed of Franciscan monks. In the same year, Father Pedro de Covilham was martyred. The first bishop in India was Duarte Nunes, a Dominican (1514-1517); and John de Albuquerque, a Franciscan, was the first Bishop of Goa (1539-1555). 3. *Xavier, and the Jesuits.*—The Jesuits commenced their labours in the East in 1542, their first missionary being Saint Francis Xavier. He completed the conversion of the Pariahs in Tinnevely, who were nominally Christians before, having received Portuguese protection against the Mahomedans. Xavier died in 1552 at San Chan, a small island off the coast of China, and was buried at Goa in 1553. Poonaycaul in Tinnevely was the scene in 1549 of the death of Father Antonio Criminalle, the proto-martyr of the Society of Jesus, and in the following year, several other missionaries lost their lives. Goa became an archbishopric in 1577. About 1596, the Archbishop of Goa, Alexis de Menezes, an Augustinian, succeeded in reconciling the Indian Nestorians to Rome, and at the Synod of Diamper (Oodiyampooram near Cochin), the affairs of the Indian Christians were settled. The Syrian rite was retained after it had been purged of its Nestorianism. 4. *Nestorianism.*—About fifty years later, emissaries from Babylon caused the whole community to relapse into Nestorianism, and the wars between the Dutch and the Portuguese at this time impeded the action of the Catholic missionaries. In 1660 however, a mission of Carmelite priests arrived, and succeeded in recovering nearly all the Indian Christians to Rome. A certain number still adhere to the Nestorian rite, and are split up into various factions, with several rival bishops. 5. *Robert de Nobili and others at Madura.*—The Jesuit mission to the Madras coast dates from 1606, and was founded at Madura by Robert de Nobili (died 1656). Other well known missionaries were John de Britto (martyred in Madura, 1693) and Beschi the great Tamil scholar (died circ. 1746). They laboured in Madura, Trichinopoly, Tanjore, Tinnevely, Salem, &c. 6. *French Jesuits in the Carnatic.*—The Jesuit Mission of the Carnatic was of French origin, and commenced about 1700, with Pondicherry for its centre. Much good work was done by these early Jesuits. Much of their influence was due to the fact that they lived and dressed just like the natives, and Robert de Nobili even gave out that he was a Brahmin. During the seventeenth and eighteenth centuries, religious troubles and difficulties as to caste observances rose in Southern India through the action of the missionaries. The Portuguese also gave some trouble by a claim to appoint the Archbishop of Goa, while the Dutch adventurers persecuted the Catholics along the coast. The literary activity of the missionaries was, however, very great. 7. *The Jesuits suppressed in Europe.*—The work of the missions was brought to a termination by political events in Europe. In 1759 Portugal broke up the Society of Jesus within its dominions, seized its property, and imprisoned its members. France did the same in 1764, and to prevent greater evils, the Pope, Clement XIV, in 1773 was forced to suppress the whole society. The French Revolution followed. These events deprived the Indian Jesuit missions both of priests and resources, and for a long time they languished. They had persecutions also to contend against, as Tippoo, about 1784, forcibly circumcised about 30,000 Catholics of Canara, and deported them to the country above the ghats. 8. *The Society of Jesus re-established.*—In 1814 the Society of Jesus was re-established, and under Gregory XVI (1831-1846) its missions revived and have since made great progress. Discord is still caused however by the claims of Portugal to appoint the Archbishop of Goa. 9. *General account of the missions.*—The Roman Catholic missions are maintained by many of the European nations, and are nearly equally divided between the secular and regular clergy. Although all are directed by Europeans, at least seven-eighths of the Roman priests are natives. Several natives have also been bishops, some of them being Brahmins. The missions are presided over by bishops (vicars and prefects apostolic), the delegates of the Pope, who governs the missions himself without the intervention of the hierarchy. Side by side with the sixteen vicars apostolic, the Archbishop of Goa has an extraordinary jurisdiction over a certain number of Catholics outside his diocese, and scattered over all India, but chiefly found in the south. The jurisdiction of the prefect apostolic of Pondicherry is confined to the French possessions. The native Catholics in the whole of India number 1,317,802, there being 1,088,940 in British India and Native States, 245,318 in Portuguese territory, and 33,544 in French territory. They are most numerous in the Native States of Travancore and Cochin. Veerapoly (in Travancore), the smallest of the Roman Catholic vicariates, contains the largest number of priests and Catholics. These are chiefly the descendants of the Nestorians converted to Rome in the sixteenth century, and are divided between the Syrian and Latin rites. The Roman Catholics in India seem to be steadily increasing, chiefly in the south. The converts are chiefly of the agricultural class, but are by no means confined to the low castes. The principal Catholic educational establishments in Southern India are the Jesuit colleges at Negapatam and Mangalore. There are not many English priests, so that Catholic missions have much difficulty in maintaining colleges and schools where English is the vehicle of higher education. The pecuniary resources of the Catholic missions in India are somewhat slender, their main support being derived from two great Catholic organizations, the association for the Propagation of the Faith, and the Society of the Holy Childhood. The former contributes Rupees 2,44,640 yearly to Indian missions, and the latter Rupees 1,23,000, making a total of 3,67,640 rupees.

[6] **SKETCH HISTORY OF CATHOLIC MISSION OF MADRAS.**—*French Capuchin Mission.*—The Catholic mission of Madras was founded by the Capuchin fathers in the year 1642, with the sanction and approbation of Pope Urban VIII. Father Ephraïme Nevers, a native of Auxerre, brother of M. de Chateau, Councillor of Paris, was the first missionary of the order who came to Madras. Destined for the mission of Pegu, he arrived at Surat and travelled thence by land to Masulipatam in hopes of finding there a vessel to take him to his mission. In this he was disappointed, and under advice he proceeded south to Madras, where, he was assured, he could easily obtain passage. On his arrival he met with a cordial reception from the few Catholics then to be found in the English factory at Madras. They proposed to him to remain with them, and their proposal met with the approval of the president of the settlement. Father Ephraïme deemed this a favorable opportunity for establishing a new mission for his order and consented to remain on condition that the project was approved by the Holy See. He accordingly wrote to Rome and represented that there was a prospect of more satisfactory mission work at Madras than at Pegu, and in the course of a short time received the intelligence that the Pope fully approved of the project and raised the Capuchin mission of Madras to the rank of a Prefecture Apostolic. Father Ephraïme was soon provided with a residence and a humble place for celebration of the mass. (2) *Disputes with Portuguese Mission.*—The Portuguese mission at Saint Thomé had been long since established, but Portugal was then and for years previously unable to supply the requisite number of persons for the missions in the East. By the Brief "Etsi Pastoralis" of 1633 the then reigning Pontiff, Urban VIII, invited missionaries, both secular and regular, to enter the Eastern mission. The establishment of a Prefecture Apostolic at Madras was however distasteful to the Portuguese ecclesiastics at Saint Thomé, and although for a time friendly feelings seemed to exist, yet in 1649, when Father Ephraïme was on a visit to his co-religionists at Saint Thomé, he was seized by some officers of the Goa Inquisition, placed on board a small frigate which was then ready to sail, and carried off to Goa. Father Zenon Debaux, a Capuchin, who came to India with Father Ephraïme, repaired at once from Surat to Goa to effect, if possible, his friend's release. Failing in his attempt, he came to Madras and adopted the following measure to effect his deliverance. Knowing that it was the custom of the president of the Saint Thomé factory to perform some devotions on certain days in a small church outside the factory, he with the aid of a few Irishmen seized him and incarcerated him in a room in Fort Saint George as a hostage for Father Ephraïme, promising to set him free as soon as it should be known at Madras that Father Ephraïme had been liberated from the Goa Inquisition. The president however, after some days, effected his escape, and this stratagem fell through.

There are no Catholic Bishops' sees in the Presidency, but Vicariates Apostolic have been created by the Pope, and the Archbishop of Goa has been given extraordinary jurisdiction by the Pope beyond Portuguese territory. The Vicariates are presided

Father Ephraim was indebted for his release to Abdoollah Cootb Khan, King of Golcondah, with whom he became acquainted on his way from Surat to Masulipatam. The king's army was then in the neighbourhood of Saint Thomé, and when he heard of the treachery practised on Father Ephraim, he threatened to destroy the Portuguese factory if he were not set at liberty before the expiration of two months. The threat was conveyed to Goa and Ephraim was set free after an imprisonment of 22 months and 22 days including the time spent on the voyage there. (3) *Restrictions by the Government.*—More than thirty years passed after Father Ephraim's first arrival at Madras before he succeeded in erecting a convenient church. At length in 1675 one was erected in Fort Saint George and opened for Divine service under the protection and with the approbation of the Governor, Sir William Langhorne. The Governor ordered a salute of cannon and a volley of small arms to be fired by all soldiers in garrison in honor of the dedication of the new church. A complaint was forwarded to the Court of Directors by the Reverend Patrick Warner, the Protestant Chaplain of Fort Saint George, against this act of the Governor. His conduct was marked by an expression of the Court's displeasure, and within two years he was recalled. The Government orders of the next few years provided that the Portuguese priests who came to reside in Madras should be watched in all their movements and removed from the town as opportunity offered. Protection was to be given to Fathers Ephraim and Zenon, who, as stated in the orders, had ever behaved themselves with all due respect to the Government of the place and to the English interests. Rules were laid down to be observed on the occasion of mixed marriages, and the baptism and education of children begotten and born of such marriages. On the occasion of mixed marriages, the Protestant chaplain exacted an oath from the contracting parties that all the children should be brought up in the Protestant religion; but in a report of his to the Court of Directors in January 1676 he expresses his wonder that the oath was seldom or never observed. The Catholic religion makes it a sin to take such an oath, and still more to observe it. (4) *Opening of a Church in Black Town, Madras.*—From a Directory of Fort Saint George preserved in the public records and dated 16th August 1688, it appears that there were four Capuchin fathers then residing in Fort Saint George, Fathers Ephraim, Theodosia, Lorenzo Pereira, and Salvador. Besides the new church in Fort Saint George, the Capuchins had a small church or chapel in Black Town, about midway between the fort and the church in Armenian Street. This chapel was very much out of repair in 1692, and permission was granted by the Governor for its repair, but with exceptions and restrictions. It was not to be enlarged, nor rebuilt higher and stronger than formerly, nor must it in any way be prejudicial to the surrounding houses nor to the freedom of the fort guns. There is a copy of this agreement still preserved in the Armenian church at Madras. (5) *First half of eighteenth century.*—In half a century after Father Ephraim came to Madras, his congregation had increased from 80 to 8,000 souls. Disabled by age and by his long services, he applied to the Governor for permission for another Capuchin priest to reside at Madras, which permission was graciously granted by an order of Government dated the 25th September 1693. During the next few years of the history of the mission there is little to record, except an attempt on the part of the Bishop of Saint Thomé to exercise jurisdiction over the Capuchin fathers. This was resisted by the Governor in Council, who declared in a general order dated 7th July 1698, that no Bishop whatsoever of the Roman Catholic religion had any power or jurisdiction over the clergy or laymen of that persuasion residing under the Government. In the year 1704, when the Legate Apostolic sent by Pope Clement XI requested Father Michael Ange du Bouge to meet him at Pondicherry, the Government passed a resolution that they would allow no one to exercise authority over the priests of Madras. Father Michael was forbidden to leave the town, and the officers were ordered to prevent him if he should attempt to go without the gates. At this date and for many subsequent years the Capuchin fathers were held in high esteem, and when charges were brought against them the Government of Fort Saint George, under the presidency of Edward Harrison, in 1716 bore testimony as to their character, declaring that the Capuchin fathers "have always demeaned themselves in so handsome a manner, both in spiritual and temporal affairs, as to give no just cause of complaint to us, their representatives; their conduct has been regular and agreeable to their profession, nor have we ever heard of or remarked any action of theirs that would occasion the least scandal to their order." Amongst the Capuchin fathers of those days special mention may be made of Father Thomas de Poitiers, a man of superior merit and ability. By his thriftiness and economy, Father Thomas had accumulated a large sum of money, the greater portion of which we are told he employed in building a church and residence for the Capuchin fathers in Fort Saint George. The two buildings cost nearly one lakh and a half rupees. In addition to the property possessed by the Capuchins in Fort Saint George by the will of Peter Uskan, a wealthy Armenian, dated 19th January 1760, the church or chapel of Our Lady of Miracles, with all the building, garden and ground belonging to the same church, were placed under their absolute and free possession. (6) *Second half of eighteenth century.*—In 1744 war was declared by England against France. Madras was taken by the French in September 1746. Unfavorable reports were made of the conduct of the priests and the Catholic inhabitants on the occasion of the town being attacked by the French. Accordingly in a general letter of the Court of Directors dated 27th January 1747, and addressed to the Governor and Council of Fort Saint David, Catholics and their priests were strictly forbidden to dwell within the boundaries of Madras, and should any of them have been employed in places of trust, they were ordered immediately to be dismissed. The Capuchin missionaries of Madras were now out of favor. One of them, Father René, was summarily transported to Lisbon, two others were ejected from Fort Saint George and their houses and church were appropriated to the uses of Government. Their church and house at Vepery would have been similarly confiscated had it not been for the protest of Peter Uskan himself, who was then living. His death however which occurred shortly afterwards, afforded the Government an opportunity of carrying out their original determination, and the church and presbytery at Vepery were

Government, under the order of the Court of Directors, a compensation of 12,000 pagodas for the confiscations in Fort Saint George and Vepery. It is said that the original cost of Peter Uskan's church and garden in Vepery was double the amount of the compensation given and the original cost of the church and hospice in Fort Saint George was six times the amount of the compensation. In 1749, when the Capuchins were ejected from the fort, they erected huts in the cemetery in Armenian Street, where they were allowed to remain for seven years and where they built a house and laid the foundations of a church. In 1756, when Madras was attacked by M. Labourdonnais, they were ordered to quit the town and repair to Poolicat, where they remained until the siege of Madras was raised by Lally in 1769. The house of the Capuchins in the Armenian Street cemetery was taken up by Government for a hospital, and was retained as such for fourteen years. The Government, at the request of Father Severini, granted an allowance of 15 pagodas per month for the time that it was occupied as a hospital, and for so long as it may continue to be appropriated to that use. About this time the conduct of Government changed with regard to the relationship existing between the Capuchin fathers and the Bishop of Saint Thomé. Heretofore his spiritual authority in the British possessions had been denied, but at this period the British possessions, like other places round the coast of Coromandel, were acknowledged to be within his diocese. In 1787 the property of the mission also was placed under the charge of four syndics appointed by Government, and the Superior of the Capuchins was obliged to render an exact account of the funds belonging to the Capuchin mission. Matters both spiritual and temporal remained in this condition for about twenty-seven years. In 1814 Father Fidelis, the then Superior of the mission, considering the furnishing of such accounts to laymen an indignity to the community of the Capuchins and an illegal exaction, refused to render accounts for the future. He complained to Government and was referred to the Supreme Court. After a lengthened law suit, which lasted nearly four years, a verdict was given in favor of the Capuchins, and the syndics were ordered to assign over the funds and securities in their possession to the Capuchins, to be administered by the Apostolic Prefect. The cost of this suit to the Capuchin mission, although the verdict was in their favor, amounted to over 10,000 rupees. During the next few years the Capuchins appeared frequently in the Supreme Court of Madras either as plaintiffs or defendants, and as the old accounts show, had to expend another sum of over 10,000 rupees as taxed bills of costs between plaintiffs and defendants. (7) *Nineteenth century.*—On the 18th March 1808 the Reverend Father John Baptist was appointed Prefect Apostolic of the Madras mission, and continued to fulfil the duties of his office till the end of 1834. At the request of the Catholics of Madras, the Holy See about the middle of that year appointed the

over by titular Bishops. The Roman Catholic Bishop, or Vicar Apostolic of Madras, receives a stipend of Rs. 500 per mensem from the Madras Government for furnishing ecclesiastical returns. The Archbishop of Goa controls all the Portuguese clergy serving within the vicariates. There are thus two establishments of Catholic clergy. Boundaries and other statistics of the vicariates and the archbishopric are given below.[⁷] In a table below[⁸] is also given for comparison a list of all the vicariates in Southern India and immediate neighbourhood with statistics. The Indian Vicariates not here mentioned are Bombay, Agra, Patna, Punjab, Calcutta (including Chandernagore), Central Bengal, Eastern Bengal, Northern Burmah, Southern Burmah, Eastern Burmah, the Malayan Peninsula, and Siam. There are no legal enactments in this country concerning the Catholic church, except incidentally.

815. TRAVANCORE BISHOPRIC.—The ecclesiastical supervision of the Church of England in Travancore and Cochin, formerly exercised by Bishops of Calcutta and

Reverend Daniel O'Connor, a distinguished member of the Augustinian Order in Ireland, as the first Vicar Apostolic of Madras. He was consecrated Bishop by the Right Reverend Doctor Murphy, Bishop of Cork, on the 3rd August 1834, and shortly afterwards left Ireland for India with a few missionaries and ecclesiastical students. His reception in Madras was cordial. On the 24th April 1838, in the Pontificate of Gregory XVI, the Bull *multa preclara* was issued, in which it is decreed that all those countries which were contained in the diocese of Meliapore or Saint Thomas, and which as yet were committed to the care of no Vicar Apostolic, were to be united to the Vicariate Apostolic of Madras, and that the jurisdiction and entire ecclesiastical and spiritual authority in those countries should belong henceforward to the Right Reverend Daniel, Bishop of Saldes and Vicar Apostolic of Madras, and to his successors. Doctor O'Connor shortly after receiving and publishing this Bull claimed jurisdiction over the churches of the Saint Thomé mission and appointed a day for his installation in the church of Saint Thomas at Mylapore, as Vicar Apostolic of Madras and Mylapore, in accordance with the terms of the above-mentioned Bull. The ecclesiastical authorities at Saint Thomé refused to allow the installation to take place in that church and also to recognize the force of the Bull *multa preclara* since it was not transmitted to them by the Government of Goa or Portugal. In 1839 Doctor O'Connor's health having broken down, the Right Reverend Doctor B. Carew was appointed Bishop of Edessa and Coadjutor Vicar Apostolic of Madras. After some time Doctor O'Connor retired from the mission, returned to Ireland, and remained in the Augustinian House in Dublin to the date of his death in 1869. Towards the end of 1841 Doctor Carew was appointed Archbishop of Edessa and translated to Calcutta as Vicar Apostolic. Doctor John Fennelly, who was then one on the staff of the Royal College of Maynooth, was appointed his successor. He was consecrated in Ireland and arrived in Madras on the 23rd January 1842. At that time the Vicariate Apostolic of Madras comprised not only principal portions of this Presidency, but extended to the north as far as the Godavery, and to the south it included the present South Arcot District. The Teloogee missions in Goontoor, Kurnool and the Chingleput Districts then belonged to the Vicariate Apostolic of Pondicherry. By a mutual arrangement entered into between the then Vicar Apostolic of Madras and Pondicherry, and approved of by the Holy See, the missions north of the Palaur were ceded to Madras and the missions south of the Palaur to Pondicherry. Owing to the increase in numbers of the Christians in those missions, it was considered advisable by the Holy See to subdivide the Vicariates Apostolic of Madras and Pondicherry, and in 1846 the old Vicariate Apostolic of Madras was thus subdivided. The Vicariate Apostolic of Madras was henceforth bounded on the south by the River Palaur and on the north by the Kistna. The new Vicariate of Hyderabad was to be bounded on the south by the Kistna and on the north by the Godavery. The Vicariate Apostolic of Vizagapatam was to be bounded on the south by the Godavery and to include within it all that part of India south of the Bengal territory. The Vicariate Apostolic of Pondicherry was also subdivided into the Vicariates Apostolic of Pondicherry, Mysore and Coimbatore. The boundary of the new Vicariate of Pondicherry was to include all that country lying between the Palaur on the north and the Cauvery on the south. The Vicariate Apostolic of Mysore was to comprise the territories of the Rajah of Mysore, the British provinces of Coorg, Collegaui and part of the Wynaud; that of Coimbatore to include the collectorate of Coimbatore, the Neilgherries, and the Chittoor talook in the Cochin territory. (8) *Recent incumbents of Bishopric.*—The Right Reverend Doctor John Fennelly died on the 28th January 1868 and was succeeded by his brother the Right Reverend Doctor Stephen Fennelly, who, after an administration of twelve years, died on the 3rd May 1880, and was in his turn succeeded in the Vicariate Apostolicship of Madras by the present incumbent, the Right Reverend Doctor Joseph Colgan.

[⁷] VICARIATES, &c.—*Vicariate Apostolic of Madras.*—Erected 3rd July 1832, and confirmed 25th April 1834. Extending along the sea coast of Coromandel, from north to south (from the mouth of the river Kistna to the mouth of the Palaur) 300 miles; from east to west (from Madras to Moodgull) 400 miles; bounded on the south by the Vicariate Apostolic of Pondicherry and the Vicariate Apostolic of Mysore; on the west by the Vicariate Apostolic of Bombay; and on the north by the Vicariate Apostolic of Hyderabad. Total Catholic population 53,548 souls, viz., 46,744 subject to the Vicar Apostolic and 6,844 under the jurisdiction of the Archbishop of Goa. Area in square miles 47,851. (2) *Vicariate Apostolic of Pondicherry.*—Erected 8th July 1836, and 3rd June 1837. Bounded on the north by the river Palaur, which separates it from the Vicariate Apostolic of Madras; on the south by the river Cauvery, which separates it from the Vicariate of Madras; on the east by 60 miles of the coast of Coromandel, from the mouth of the Palaur to the mouth of the Vettur, one of the many streams by which the waters of the Cauvery are discharged into the Bay of Bengal; and on the west, partly by the Mysore territory, which forms its common boundary with the Vicariate Apostolic of Mysore, and partly by the river Cauvery, which, in its southerly course, separates it from the Vicariate Apostolic of Coimbatore. The Catholic population is 184,362, viz., 179,196 under the Vicar Apostolic; 2,473 under the jurisdiction of the Prefect Apostolic, and 2,691 subject to the Archbishop of Goa. (3) *Vicariate Apostolic of Vizagapatam.*—Erected 3rd April 1850. Extending along the Bay of Bengal from Cuttack to the mouth of the Godavery; bounded on the north by the Bengal Presidency; on the west by the Bombay Presidency; and on the south by the Vicariate Apostolic of Hyderabad. Catholic population about 18,185. The Vicariate Apostolic of Vizagapatam is one of the most extensive in India. In it there is no priest, church, or congregation subject to the Archbishop of Goa. (4) *Vicariate Apostolic of Coimbatore.*—Erected in 1850. Bounded on the north by the Vicariate Apostolic of Mysore, on the west by the Vicariate Apostolic of Mangalore and Veerapoly, on the east by the Vicariate Apostolic of Pondicherry, and on the south by the Vicariate Apostolic of Madras and the mountains of Travancore. The Vicariate includes, 1st, the Collectorate of Coimbatore, excepting the Collegaui; 2nd, the Neilgherries; 3rd, the talooks of Palghat, Colanoda, Jamaypooram and other parts situated in the south of Wynaud in the western declivity of the ghats in the Malabar Collectorate; 4th, the Chittoor talook in the Cochin territory. General population of the Vicariate 2,000,000, total Catholic population 24,027. Here also there is no priest, church or congregation subject to the Archbishop of Goa. (5) *Vicariate Apostolic of Madras.*—Erected in 1846. Bounded on the north by the Vicariate Apostolic of Pondicherry; on the north-west by the Vicariate Apostolic of Coimbatore; on the west by the Vicariate Apostolic of Veerapoly, and the Vicariate Apostolic of Quilon, from both of which it is separated by the Southern Ghats; and on the east and south-east by about 150 miles of sea coast, extending from Negapatam to Cape Comorin. The Vicariate contains 166 churches and 561 chapels, and is served by 66 priests. Catholic population 176,169, viz., 151,669 under the Vicar Apostolic, and 24,500 under the Archbishop of Goa. (6) *Vicariate Apostolic of Mangalore.*—

since 1835 by Bishops of Madras with the tacit consent of the native rulers, was transferred in 1880 to a Bishop consecrated for the purpose. Under the Act of 5 Victoria, commonly called the Jerusalem Bishopric Act, a Royal License was issued, dated 16th July 1879, to the Archbishop of Canterbury, authorizing him to consecrate. The consecration took place on the 25th of July 1879, and on the 27th of January 1880 the present Bishop arrived in India. His station is Cottayam. The number of Native Christians thus transferred from the superintendence of the Bishop of Madras was about 16,500 baptized and 2,100 under instruction.

REGISTRATION OF MARRIAGES.

816. INTRODUCTION.—Under the Indian Christian Marriage Act, India No. XV of 1872, [1] marriages may be solemnized by (a) any person who has received episcopal jurisdiction; (b) by clergymen of the Church of Scotland; (c) by any minister of

Erected in 1853. The Vicariate Apostolic of Mangalore is bounded on the south by the Vicariate Apostolic of Veerapoly, on the north by the Archdiocese of Goa, on the east by the ghats and on the west by upwards of 300 miles of sea-coast. It varies in breadth from east to west between 40 and 60 miles. It comprises a portion of the Collectorate of Malabar, from Ponnany to Mount Dolly, a portion of the Collectorate of North Canara, and the whole of the Collectorate of South Canara. The Society of Jesus having been ordered by the Holy See in 1878 to undertake the charge of the vicariate, several members of the Society arrived in December 1878. Since then their number has increased. They now number twenty-nine in all, of whom twenty-two are priests, four novices and five lay brothers. The Catholic population of the vicariate amounts to 76,000 souls, of whom more than 50,000 are subject to the Vicar Apostolic, the rest to the Archbishop of Goa. (7) *Arch-diocese of Goa*.—The Franciscans arrived in Goa in 1517. Pope Paul III raised that city to an episcopal see on the 3rd November 1534, placing under its spiritual jurisdiction all the Portuguese possessions from the Cape of Good Hope to China. It was, however, made suffragan to the Archbishopric of Funchal, in the island of Madeira, to which ever since 1515 all the foreign missions founded by the Portuguese had been subordinate. The first Bishop appointed to the See of Goa having died before his departure from Portugal, the Pope invested, with episcopal authority, a Franciscan friar, named Dom Fr. Joao de Albuquerque, who took charge of his diocese in 1538, and established a chapter in the same year. It is divided into the Velhas and Novas Conquistas, or the Old and New Conquests. The former, which came under the Portuguese sway at an early date, comprises the three provinces of the Ilhas, Salsette, and Bardes, with an area of 48, 102, and 72 square miles, respectively. The latter, conquered at a comparatively recent date, consists of four divisions composed of the following provinces:—Pernun, 73 square miles; Bicholim or Batagrama, 67 square miles; Satari, 144 square miles; Ponda or Antroz, 79 miles; Canacona, 113 square miles, Embarbacem, 188 square miles; Cacora, 5 square miles; Chandrovary, 37 square miles; Baili, 57 square miles; Astagar, 77 square miles. The last five are collectively known under the name of Zambaulim, or Punch-Mahaul. The island of Anjediva and the district of Tiracol, having each an area of one square mile, are also, for administrative purposes, included in the territory of Goa.

[2] SUMMARY OF THE CATHOLIC STATISTICS OF SOUTHERN INDIA, &c.

[1] SKETCH HISTORY OF CHANGES IN THE LAW IN THE INDIAN CHRISTIAN MARRIAGE ACTS.—The office of Marriage Registrar was created by one of the provisions contained in Statute 14 and 15 Vic., cap. XL, entitled an "Act for Marriages in India," which was extended to this Presidency by the Government of India Act No. V of 1853. There have been three repealing Acts since then; India Act XXV of 1864, India Act V of 1865, and India Act XV of 1872. The last named Act, or "The Indian Christian Marriage Act," is the law now in force. The object of the Indian Christian Marriage Act was to consolidate and amend the enactments relating to the solemnization in India either by the Clergy or by a Civil Registrar of marriages of persons professing the Christian religion. Opportunity was taken to extend the entire law relating to Christian marriages to British subjects in native allied states; and to remove ambiguity in the provisions of the pre-existing law as to the submission of returns of marriages solemnized between Native Christians by clearly laying down the rule that the returns of such marriages, however they might have been solemnized, were not required. The law is applicable to all Christians, i.e., persons professing the Christian religion; and expression "Native Christians" includes the Christian descendants of natives of India converted to Christianity, as well as such converts. The most important amendment as compared with the previous law was in regard to the certifying of marriages between Native Christians under Part V of Act V of 1865. By that Act, if the persons intending marriage had attained the age of sixteen years in the case of the male and thirteen years in the case of the female, the marriage might be certified without any reference to the consent of parents or guardians. This was remedied by a provision that no such marriage should be certified when either of the parties intending to be married had not completed his or her eighteenth year, unless the consent of the father, guardian, or mother had been given to the intended marriage, or unless it appeared that there was no person living authorised to give such consent.

religion licensed under the Act; (d) by, or in the presence of, a Marriage Registrar appointed under the Act; and (e) by any person licensed under the Act to grant certificates of marriages between Native Christians. The fourth head is treated of in this article. The Brahmo Marriage Act, India No. III of 1872, was passed for the marriage of persons other than Hindoos, Mahomedans, and Christians; and, since it came into force in 1872, the Senior Marriage Registrar for the town of Madras has also been appointed a Marriage Registrar under this Act.

817. PROCEDURE.—The duties of Marriage Registrars under India Act XV of 1872 are set forth in Part V of the Act, the provisions of which in their general contexture are somewhat similar to the procedure adopted in the presence of a Registrar in England. When a marriage is to be solemnized one of the parties gives the Marriage Registrar notice as perform in Schedule I of the Act. On receiving the notice, the Registrar affixes a copy in some conspicuous place in his office. If one of the parties is a minor, he sends a copy to each of the other Marriage Registrars (if any) in the same revenue district for publication. He files all notices received by him and enters a true copy of each in a book called the "Marriage Notice Book," which is open for inspection by the public at all reasonable times without fee. When the party giving notice of the marriage has made the oath required by section 42 of the Act and requests the issue of the certificate (Schedule II), the Registrar issues under his hand a certificate of such notice having been given and of such oath having been made. But he acts thus provided only that there is no lawful impediment; that issue of certificate has not been forbidden by any person authorized in that behalf by the Act; that four days have expired since receipt of notice; and further, when one of the parties is a minor, that fourteen days have expired. In the latter case, if both parties are residing at Madras, and are desirous of being married in less than fourteen days, they may apply by petition to a Judge of the High Court for an order directing the Marriage Registrar to issue his certificate before the expiration of fourteen days. Any person whose consent to the marriage of a minor is necessary may enter a protest against the issue of the Registrar's certificate by writing at any time before its issue the word "forbidden" opposite to the entry of the notice in the "Marriage Notice Book," and subscribing his or her name thereto. Every such person is liable for the costs of all proceedings in relation thereto and for damages, if the grounds of protest be found to be frivolous. When a protest has been entered, the Marriage Registrar withholds the issue of his certificate until satisfied that the protest ought not to obstruct its issue, or until the protest is itself withdrawn by the person who entered it; or the Registrar may himself apply by petition stating all the circumstances of the case, and pray for an order and direction of Court. If the person whose consent is necessary is insane, or unjustly withholds consent, the parties interested may petition a Judge of the High Court or of a District Court to examine the matter, and if upon such examination it shall be declared that the marriage is proper, the declaration is as effectual as if the person whose consent was needed had consented to the marriage, and the Registrar issues his certificate. Should however a Marriage Registrar himself refuse to issue a certificate the parties concerned may petition as above, and the decision of the Judge of the High Court or of the District Court in the case is final. After the grant to the parties of the certificate by the Marriage Registrar, the marriage is solemnized at any time within two months by the Registrar himself according to such form and ceremony as the parties think fit to adopt. The Registrar's certificate does not authorize marriage by any other officer. The refusal of a certificate by one Registrar does not make a subsequent marriage by another Registrar illegal, but the refusal in the first instance would furnish good grounds for a refusal in the second case also. The ceremony invariably takes place in the presence of two or more credible witnesses, and in a part of the ceremony each of the parties declares that he or she knows of no lawful impediment to the union. When a marriage is not solemnized within two months after receipt of the notice, the notice and the certificate and all other proceedings thereupon are considered void. After the solemnization of a marriage, the Registrar registers it in a Marriage Registrar's Book (Schedule IV), and also in a certificate attached to the book as a counterfoil. The entries in the register are signed by the Registrar, by the parties married, and

by the two credible witnesses in whose presence the ceremony takes place. The certificate attached to the book is sent by the Registrar to the Secretary to the Local Government. The book itself is kept by the Registrar until it is filled, when it is also sent to the Government. In the rules published in the Fort St. George Gazette, dated 17th March 1874, the Government have, under the provisions of Sections 82 and 83 of the Marriage Act, authorized the levy of certain fees, and have prescribed the manner in which they shall be disposed of. These rules have the force of law.

818. ESTABLISHMENT.—Besides a Senior Marriage Registrar in the town of Madras there are 21 such officers in the Presidency located in the districts of North Arcot, South Arcot, Bellary, South Canara, Cochin, Coimbatore, Cuddapah, Ganjam, Godavery, Kistna, Kurnool, Madura, Malabar, Nellore, Salem, Tanjore, Tinnevely, Trichinopoly, and Vizagapatam and in the Travancore State.

CHARITIES.

819. INTRODUCTION.—Endowments and inams may be taken to be cases where the Government are pledged to give by contract express or implied; charities where Government are not so pledged. Under this definition, the charitable institutions to which Government contribute directly are shown in the list at foot.^[1] In the following paragraphs information is given about the principal institutions. As regards the general question of State charity in this country, it may be mentioned that the operations of Government are confined to subsidizing certain institutions supported by voluntary contributions which have been found for special reasons to be desirable in certain localities, and to acting as public almoners in times of extreme famine. The latter is a subject treated of in a separate article. For a poor law applicable to the native community there are not sufficient grounds in this country, and there would be unusual difficulties in carrying it out. The diffusion of property is moderately equal among the native population, and the great bulk of the people are of temperate and frugal habits. Further the strong co-operative social union which prevails, every family supporting its own indigent members, reduces actual pauperism within a very small limit. The relief of professional mendicants is indeed a religious observance; but the class of these is small, consisting mainly of cripples and of the lowest out-castes among whom the family tie is weak. As regards the difficulty of giving State relief in India, if it were thought necessary, the experience of other countries shows that it must take the form of poor-houses with in-door relief. In a country where the greater part of the population are poor, such institutions must when once begun be continued on a scale which would be prohibitive with regard to the means of Government. A poor-tax has never yet been levied in India. Further the discrimination in poor-houses between deserving cases and those not so deserving would be very difficult, owing to the general level of poverty already mentioned. A special poor-tax and poor-law, confined in their operation to Europeans and Eurasians, have been proposed; but this case is met by the special institutions established in large towns

820. OOTACAMUND LAWRENCE ASYLUM.—Sir Henry Lawrence in 1856, after having established the Hill Asylums for the children of British soldiers at Sanawar and Mount Aboo, offered a donation of Rupees 5,000 if a similar institution could be founded on the Neilgherries. The proposal was favorably received by the residents at Ootacamund, but the project fell through owing to a want of unanimity in regard to the religious basis upon which the asylum was to be founded. Two years later, in 1858, after Sir Henry Lawrence's death, the matter was again brought forward and the present asylum was established. The object in establishing the asylum was two-fold; first, to do honor to the memory of Sir Henry Lawrence, and secondly to benefit the children of the European soldiery by providing a refuge from the debilitating effects of a tropical climate and the demoralizing influence of barrack life. The Lawrence Asylum, when first instituted, was supported by annual donations and monthly subscriptions from the public, both military and civil. Out of the funds raised thus a portion was invested in Government securities, and the properties known as Stonehouse and Lower Norwood were purchased for Rupees 30,500. On the adoption of the rules of the Lawrence Asylum at Sanawar Government sanctioned a monthly grant of Rupees 500, which was subsequently raised to a maximum of Rupees 4,000 per mensem. This was intended to cover all expenditure in connection with the education and maintenance of 150 boys and 80 girls. The Government, in return, took over all the funds of the institution. On the amalgamation of the Military Male Orphan Asylum with the Ootacamund Lawrence Asylum being decided on, Government issued orders to the Public Works Department for the erection of the buildings at Lovedale. The amalgamation was effected in September 1871, when the Military Male Orphan Asylum premises at Madras, valued at from Rupees 50,000 to 80,000, together with "Stonehouse" and "Lower Norwood" at Ootacamund were made over to Government. No further grant was made at the amalgamation of the two asylums, although the number of boys was increased by 200, the interest, &c., on the funded capital of the Military Male Orphan Asylum being considered sufficient for the maintenance of the increased number of boys. The funded capital contributed to the Lawrence Asylum by the Military Male Orphan Asylum amounts to Rupees 4,89,200, and is lodged with the Accountant-General. In addition, the monthly grant of Rupees 500 sanctioned by the East India Court of Directors, when the Military Male Orphan Asylum was founded, has been continued. The grounds for the amalgamation of these two institutions are set forth as follows in a letter from the "Committee for the establishment of an asylum for the children of European soldiers on the Neilgherry Hills," in 1856, to the Military Secretary to Government:—"But if we might be permitted to suggest a means whereby an important aid could be given to the project, provided the Government deemed it desirable and advantageous to sanction such a measure, it appears to us that the transfer of the Male and Female Asylums of Madras to these hills, subject to the rules and constitution of the Lawrence Asylum in Bengal, would not only render a material and lasting benefit to the health and improved condition and instruction of the youths of these institutions, but the measure would at once establish the wished-for asylum; for, without some such substantial aid from Government, all private means and benevolence, however great, would be found insufficient to bring into existence and maintain the cost of an asylum for all the legitimate children of the soldiers of this army." The asylum consists of two branches, male and female. Owing to the want of a separate building for a hospital, the number of boys is limited to 330. The number of girls is limited to 60, as the building in which they are located is not capable of accommodating more than that number. The strength of the school on the 31st March 1884 was 302 boys and 59 girls. The management of the institution is placed in the hands of a committee of nine members, four of whom are appointed by Government. The Commander-in-Chief and the Bishop of Madras are the patrons of the institution. The principal of the asylums must be a clergyman of the Church of England, and his appointment is subject to the approval of the Governor in Council. In addition to the grants from Government mentioned above, the asylum realizes Rs. 38,828 per annum as donations and interest on Government securities. The Asylum Press contributes a liberal donation of Rupees 10,000 yearly. About Rupees 1,000 per

mensem is the average sum drawn as military pay and orphan allowance. The other sources of income are variable. The total income in 1883-84 of the male branch was Rs. 1,18,502 and of the female branch, Rs. 20,797.

821. MADRAS MONIGAR CHOULTRY.—The Monigar Choultry at Madras is an institution which affords shelter, food, and clothing to the native poor and infirm. It was founded in the year 1808, but why it was named as above cannot now be ascertained. The institution is supported by public contributions aided largely by the Government. The total receipts of the institution in 1883 were Rs. 16,328. The average daily number of paupers maintained during the year in the choultry was 80, and of patients in the Native Infirmary 106. There were 7 children in the Foundling Asylum. The management is placed under the supervision of a committee selected annually by Government from amongst the European and Native community. In 1867 the Vencatagherry Rajah built a choultry to the east of the Monigar Choultry, which cost about Rupees 9,400. In this 70 paupers are fed daily and clothed, and 180 out-door poor receive two ollucks of raw rice per diem. The rajah contributes annually Rupees 5,000 to meet the expenses of this branch of the charity. He has also forwarded to the directors a lakh of rupees, the interest of which is to further support the institution. A citizen named Vencatasawmy Naidoo, recently deceased, left a legacy of Rupees 24,000 to the institution, the interest to go to the general fund. There have been other benefactors. A Lying-in Hospital, attached to the choultry, built by P. S. Ramasawmy Moodelly, one of the native directors, is now in active operation, and has supplied a want long felt in that part of the town. This institution is also the preparatory training school for the students of the Auxiliary Medical School.

822. MADRAS TRIPPLICANE LUNGHERKHANA.—This is a poor-house of considerable antiquity, and was taken over by the Government from the Carnatic Circar in 1857. Charity is dispensed to out-door and in-door paupers to the extent of Rupees 400 monthly, which is the amount of the Government endowment. There were 3,549 out-door paupers relieved during the year 1883-84, and 116 persons were fed, clad, and kept in the institution as inmate paupers. The institution is managed by the Deputy Commissioner of Police for Madras.

823. MADRAS FRIEND-IN-NEED SOCIETY.—This is supported by voluntary contribution with a Government grant of 50 per cent. thereon. The objects of the society are the relief of the poor and the suppression of mendicancy among Europeans and East Indians of Madras town. The society's home in the Poonamallee road affords an asylum for the aged, infirm, and destitute; its labour-yard provides a test for able-bodied male mendicants, and poor women are employed at the Women's workshops, Mount Road and St. Thomé, where plain needle-work of all kinds is executed for the public. Pensions and casual relief are granted in cases considered more fit for out-door than for in-door relief. To ensure proper relief in all cases, and the detection and exposure of imposture, Madras is divided into eight districts managed by local committees who carefully investigate all applications. This is the oldest charitable institution in Madras.

824. MADRAS GORDON REFUGE.—The design of this institution at Madras is to afford a refuge for such destitute orphan girls of European descent as are not eligible for either the Military or the Civil Female Orphan Asylums. It was commenced in 1860 by Mrs. W. A. Morehead, by whose exertions sufficient money was raised to purchase the premises at St. Thomé where the refuge is now located. Subsequently the trustees of the property of the late Mrs. Gordon of St. Thomas' Mount endowed it to the amount of about 700 rupees per mensem on condition that it assumed its present title. From 1st April 1873 the institution has received a grant-in-aid from Government of Rupees 100 per mensem provided the subscriptions reach that amount. The number of children now in the refuge is 55. The cost of maintaining each child, inclusive of superintendence, food, and clothing, is about Rupees 8-8-0 a month.

825. BELLARY PROTESTANT ORPHAN ASYLUM.—For many years this institution has been instrumental in providing for large numbers of destitute and orphan children, who would else undoubtedly have fallen into vice and heathenism. Thirty children

are clothed, fed, and so far educated as to fit them for gaining their own livelihood when they grow up. Instruction is also given to day scholars at the asylum school on payment of school fees.

PRINTING PRESSES.

826. GOVERNMENT PRESS.—The Government Press, as at present conducted, [1] including the branch at the Penitentiary, is in charge of a Superintendent, assisted by a staff of upwards of 740 persons employed in various printing and binding operations, the whole establishment being subject to the orders of the Chief Secretary to Government. With the exception of the compositors, who are paid by piece-work (the Government Press at Madras being the first Government printing establishment in which the system was introduced), all the Press employes receive fixed monthly salaries, ranging from Rupees 2 upwards. The rate of remuneration to the compositors for their work is 2 annas per 1,000 ens or letters, including composition, distributing, and correcting all proofs but author's, for which latter 2 annas an hour are paid. To facilitate the operations of the Press it is subdivided into departments, viz., Public, Public Works, Military, Revenue, Revenue Board, Gazette, Book, Job, Vernacular, Secret, in which latter are printed not only the confidential papers of the different branches of the Secretariat, but also a large number (about 265,000 annually) of Examination papers in English, Latin, Greek, Sanscrit, Tamul, Teloo-goo, Canarese, Malayalam, and Hindostany. In the printing department 27 machines and 44 hand-presses are constantly employed, and the work turned out comprises Government Proceedings; the Proceedings of the Board of Revenue; the Gazette; Acts and Bills in English and five Vernaculars, large numbers of which are now printed and disseminated; selections from Government Records, monthly returns, annual and other reports, District Manuals, Codes, general book-work, and a large number of forms and miscellaneous job-work for official use in the public offices throughout the Presidency. There is also attached to the Press a small stereotype and type foundry. It has been in constant operation for some years past, and is employed in stereotyping some of the forms of which large numbers of copies are required, and in casting leads, quotations, metal furniture, deficiencies in Vernacular and other founts of type, accented, diacritical, and the peculiar sorts required in printing archæological and other work of a similar nature. A complete fount of Pica Tamul has been recently cast, the punches and matrices for which were also made in the Press. At the Penitentiary branch, where about 114 prisoners are engaged, some in working the hand-presses, and some driving the machines by means of the treadmill, Land Revenue, Magisterial, Judicial, and other forms, averaging in amount upwards of 22,000,000 during the official year, are turned out for use in the mofussil. The annual number of impressions struck off at the Government Press and the Penitentiary on the average of the past five years is 37,000,000. The value of the work done during 1883-84 amounted to Rupees 3,18,447. The work issued from the Press consists mainly of the Proceedings of Government in its various departments, as well as those of the Board of Revenue and the Director of Public Instruction, amounting in all to about 1,200 papers monthly, together with Routine and other papers which go to make up the monthly volumes; Departmental Administration reports, the Gazette with

[1] SKETCH HISTORY OF THE MADRAS GOVERNMENT PRESS.—The Government Press was established in 1831, its operations being at first almost exclusively restricted to the printing of the Fort St. George Gazette, the first number of which, consisting of 12 pages, was issued on Wednesday, January 4, 1832. Subsequently the printing of the Commander-in-Chief's General Orders, Queen's Orders, and job-work on a very limited scale was introduced, together with English and Vernacular Acts. In 1845 the establishment was a small one, consisting of about 40 persons, with three Columbian presses, of English manufacture, and a few wooden presses. The printing of the Proceedings of Government was begun in 1855, when the Press establishment was increased to 95 hands, a considerable addition to the plant having been made at the same time. The Binding branch was also added about this time. In 1857 book-work printing was begun; and in 1859 the printing of the Proceedings of the Board of Revenue, which had previously been done at the Board's office, was transferred, together with such plant as the Board possessed, to the Government Press. In 1861 an important advance was made in the management of the Press by the introduction of the piece-work system of payment to compositors, which has been found to work most satisfactorily. In August 1868 a small tentative branch establishment was formed at the Penitentiary, consisting of four presses and three machines, with a supply of English and Vernacular types. Convicts were at first trained as compositors as well as pressmen, but from the inability of many of the men to read, and from recent arrangements by which long-sentenced prisoners are transferred to other jails, it has been deemed advisable to confine the convicts to press and machine work only. Within the past few years the plant has been materially added to and the establishment considerably developed.

its numerous supplements, and book-work. The former are of foolscap folio size (i.e., the size of the present work), and are, as a rule, printed in pica type, with enclosures in small pica. Tabular statements are usually printed in brevier, a still smaller size (nonpareil) being used when necessary. The book-work printing is more varied in its character both as regards the size of the page and of the type used. The most common sizes, however, are royal and demy octavos (16 pages to a sheet). Small pica and long primer are the types most usually employed for this class of work. The body of the present publication is printed in pica; the foot-notes, Appendices, and Glossary and Index, in brevier. Binding by the Government Press is for the most part of an inexpensive character, consisting chiefly of boards with printed paper covers. Cloth cases with gilt backs are also made, to a large extent, for Manual and book-work generally. Country sheepskin is much used for binding purposes, especially for the work of the Registration Department and other public offices.

827. LAWRENCE ASYLUM PRESS.—The Lawrence Asylum Press in Madras is a quasi-Government institution, the general management being entrusted to a Committee appointed by Government. The connection between the Press and the Government depends on the fact that it is part of the Ootacamund Lawrence Asylum institution, the stability of which is ultimately guaranteed by Government, although the necessity for assuming the charge on State funds has not arisen. The Press was originally attached to the Madras Military Orphan Asylum, and the latter has been amalgamated with the Lawrence Asylum. The Press is worked on commercial principles, but the proceeds go to the charity. Twenty boys apprenticed from the Lawrence Asylum are boarded and clothed at the expense of the Press. The major portion of the work turned out by the Press is surplus Government work which cannot be done at the Government Press; this is paid for by cash. The Government has exempted this Press from the payment of Imperial License Tax. The stock book value of the institution has largely increased, and at the present moment, including value of Press buildings, stands at a lakh and a half of rupees. A branch of the Press was opened at Ootacamund in 1884, and an assistant accountant was despatched to that station to ensure the accounts of the branch being kept on the same method as those in the head office. The persons employed in connection with this Press are not eligible for pension under the Uncovenanted Service Civil Pension Code, but there is a special pension fund originally formed from profits.

828. DISTRICT PRESSES.—The district presses [²] form part of the Collector's office, and are managed by a Supervisor or Head Compositor receiving a salary of Rupees 50 per mensem. The abstract at foot [³] shows the usual scale of press

[²] **SKETCH HISTORY OF MADRAS DISTRICT PRESSES.**—These were first established in 1855. In 1855 the Collector of Madras, Mr. Key, set up a small lithographic press of his own to print the ordinary correspondence of his office. The successful working of these presses was so noticeable that the Government ordered a press to be set up at the Huzoor station of all the most important collectorates. Fifteen districts were accordingly at once supplied, and by March 1859 the example had been followed in all the others except the Neilgherries and Madras. In August 1863 a press was also established in the new district of Anantapore. In 1873-74 Mr. Key, Superintending Engineer, reported the successful working of the several district presses. He brought to light the want of a manual for the guidance of the press establishment.

establishment, with variations as noticed. The existing establishment are decidedly over-worked and the system admits of expansion. Men have often to work not only out of office hours, but also on holidays. The principal work done by District Presses is at present the District Gazette, as detailed below. Labour is also economized by the use of the Press for numerous papers, such as Collectors' circulars to his subordinates; puttahs, forms of account, and other standing forms required for the Revenue Department; and circulars and papers required by other departments, for example the "Police sheet" required by the Police Department. Besides the Collector's work again the printing of forms, &c., for district public officers is carried out as far as is compatible with the resources of the Press. For this no money passes, but the officers supply their own stationery. Private work is also occasionally undertaken on payment. Press work is valued for purposes of account as shown at foot.^[4] The yearly value of the outturn of purely Government work may be taken at about Rupees 1,15,000, and this work is very cheaply obtained. The statement at foot ^[5] shows the annual value of work done and the receipts and charges during the last sixteen years.

829. DISTRICT GAZETTES.—With the establishment of presses commenced the publication of District Gazettes, which were issued for the first time in 1856-57. Their object is to provide a means for communicating to the public official or semi-official matter. The District Gazettes are published as occasion offers. The ordinary issue is monthly, but extra gazettes are frequently issued. In fact, considering the bulk of matter that has to be published, the compression of all publishing operations within a single monthly issue, as has been attempted, is rather expensive than economical, as it necessitates the maintenance of a larger stock of type and material. Where different portions of the gazette are required for filing or binding in separate series, they are published as different "parts" and separately paged. As a rule, everything is in diglott; sometimes triglott is used. All public officers are entitled to insert notifications in the gazette free of charge, but the Collector uses his discretion as to insertion. Private advertisements can be inserted in the gazette on payment at certain charges. Various officers on the

[4] SCALE OF VALUE FOR PRESS WORK IN DISTRICT PRESSES.—For a full page of foolscap, English or Vernacular, exclusive of charge for striking, as in the following table. Any part of a page less than $\frac{1}{2}$, to be charged as $\frac{1}{2}$. Small Pica English with Long Primer Tamil to be valued at Long Primer rates. Charge for striking, Rupees 2 per 1,000 impressions; or 8 annas for every 250 or fraction thereof.

free list receive the gazette free of charge. Other persons can receive it at the certain rates of prepaid payment, which includes postage; village servants and officials drawing less than 25 rupees per mensem, receiving it at half-rate.

STATIONERY DEPARTMENT.

830. SUPPLY.—The Government Stationery Office is primarily for the gratuitous supply to public offices of the stationery required for official purposes. In a few cases however it makes money transactions and credits the sales. The Coorg Commission, the Residencies of Mysore and Travancore, and State Railways are supplied with stationery free of charge. Stationery is supplied on payment to the Adjutants of regiments of infantry, Staff officers, Wing officers, and Commandants of batteries of artillery, Local Fund Boards, Chaplains, Ramnaud and Kimedya estates, the Officers in charge of pensioners at Vizagapatam and Arnee, the Presidency College, the Inspector of Normal Schools and the Inspectress of Girls' Schools. The number of officers to whom stationery is supplied without payment is 356, and those that obtain supplies on payment are about 165, making a total of 521 officers supplied with stationery. All officers who are entitled to obtain stationery free of charge are required to submit their indents annually as per printed forms prescribed for the purpose, sanctioned by the controlling heads of their respective departments. The only department that obtains the supply on half-yearly indents is the Railway Mail Service, Madras. The several articles issued by the Stationery Office, which are about 508 in number, are obtained partly from England and partly from local manufacturers. All European articles, excepting such special articles as are required for army schools, the lithographic department of the Gun Carriage Factory, Garrison Instructors, and survey schools, headquarters, Queen's Own Sappers and Miners, are obtained from England by indent on the Secretary of State for India; those required for the above-mentioned departments being obtained direct from a private firm on indent forwarded through the Controller of Military Accounts. All the country articles are purchased locally by inviting tenders. The most important of these is country paper manufactured at Madras; a coarse kind of brown paper largely used in public offices for official covers and for packing purposes. Waste paper transmitted to this office by other public offices at the Presidency is sold under contract to one of the country-paper manufacturers who utilizes it in the manufacture. In the notes in the article on Manufactures and Industries will be found remarks regarding the condition and prospects of paper manufacture in the Presidency. Wooden articles, such as ink-stands, paper-weights, and rulers, are obtained from the Gun Carriage Factory, and delf ink-bottles from the School of Arts, Madras, where they are manufactured. In Vol. II, App. LXX are given particulars as to all the articles of stationery supplied on indent to departmental officers by the Government Stationery Office. Paper of a larger size than foolscap being generally used for permanent registers is supplied hand-made. In foolscaps for superior correspondence a machine-made cream-wove paper is chiefly supplied. The printed records of Government in its different departments being on a page measuring $8\frac{1}{2}$ by $13\frac{1}{2}$ inches, it is desirable that the paper used in manuscript correspondence should tally in size; otherwise the wear and tear of records is increased. This uniformity has not however yet been secured in the cream-wove foolscaps. A similar cream-wove paper is supplied for demi-official correspondence in small sizes. For ordinary drafting purposes and for vernacular correspondence paper called French foolscap, which could with difficulty be used on two sides, has lately been replaced by a printing-paper known as double-double pott, 28 lb. to the ream. Rough paper made at the Bally mills in Calcutta is being substituted for Europe-made cartridge-paper, for purposes of covers. To stations where the mails are conveyed by runners, a method of transit very destructive to the covers of heavy packets, the material supplied is stronger than where the mails are conveyed by rail or part. Paper for covers is also purchased from local manufacturers. The use of pounce or black sand for blotting is discouraged, as it precludes the use of the

reverse side of the paper. White blotting-paper from the Bally mills is being introduced, weight 32 lb. per ream. The sealing-wax supplied is as much as possible of English make, the local make being inferior. The statement at foot [1] shows the value of stationery supplied during the past three years. The increase in that time is an indication of the very great enlargement of scriptory work, in spite of economies as to material.

831. CONSTITUTION OF DEPARTMENT.—The Stationery Department is in charge of a Superintendent, whose office is at Madras. The different heads of departments indent on this officer, and he in turn obtains his stock by purchase or by indent on the Secretary of State. The indents after examination in the Government Secretariat office are forwarded to the audit office. A copy of every indent is sent to the Government of India for scrutiny. A committee for reporting to Government on questions connected with the standards of articles, and their suitability for public requirements, has been sitting since 1882. This is composed of the Chief Engineer, Public Works Department, the Accountant-General, the Commissioner of Salt Revenue, the Secretary to the Board of Revenue, the Deputy Registrar of the High Court, the Under Secretary to Government in the Public Department, the Superintendent of Public Works Stores, and the Superintendent of Stationery himself. The committee thus formed in no way controls the Superintendent.

LOCAL FUND ADMINISTRATION.

832. INTRODUCTION.—The whole Presidency, except the areas comprised in the Municipal towns and the Scheduled Districts (that is to say the Hill Tracts of Ganjam, Vizagapatam and Godavery with the Zemindarry of Jeypore), is for the purposes of local administration as for those of Revenue administration divided into 21 districts.[1] The statement at foot [1] shows their respective area, population, and revenue.

[1] SKETCH HISTORY OF LOCAL FUND BOARDS IN THIS PRESIDENCY.—*Origin.*—The idea of Local Funds originated in 1853. In that year the Collector of South Arcot, Mr. Edward Maltby, in recommending the temporary reduction of land assessment in his district, pending its survey and settlement, remarked that for the 5,000 square miles of its area there was not a single district road, and that the want of such roads was much felt, and as it could not be justly expected that these roads should all be made from the public treasury, he requested that a small fraction of the land assessment, which was to be given up on the revision, might be retained as a district road fund. The rate suggested was one anna per cawny (= 1.32 acres), and it was proposed that the fund should be expended on the district roads by the Collector and the District Engineer under the sanction of the Board of Revenue, the main lines and larger bridges being provided for by Government from general revenues. The suggestion was approved and sanctioned by Government in 1854, and the plan was extended afterwards to North Arcot and other districts in which the assessments were temporarily reduced, with this difference, however, that instead of the rate being one anna per cawny, it was fixed at 2 per cent. of the assessment charged on the land. (2) *Development of Local Funds in 1855-56.*—In 1855 the idea developed itself. In that year the Government, while reviewing a report of the Board of Revenue on the management and working of the ferries in the districts, observed that there was no uniformity in the system of management and called upon the board to submit rules for the same. They also directed that the same rules might be made applicable to the cart-tax levied in Salem, and suggested that the revenues realized should not be kept in deposit or credited to general revenues as seems to have been formerly done, but brought to account under a special head, such as "Local Funds," and regularly disbursed on sanction. The board accordingly submitted rules which were sanctioned. The rules were very simple and practical. They laid down that all sums of money collected for local purposes should be carried to account under the head of "Local Funds;" that works proposed to be executed out of the local funds should be undertaken on the joint approval of the Collector and the District Engineer, estimates for masonry and timber works costing more than Rupees 2,500 alone receiving the sanction of the Chief Engineer; that the execution of works should, as a general rule, be conducted by the District Engineer; and that an annual report should be submitted by the Collector to the board, and by the board to Government, of the operations within the year. They also observed that "at present the funds can hardly be more divided than by allotting a suitable portion to each division of a district under

833. CONSTITUTION OF LOCAL BODIES.—The constitution of the Boards was till 31st March 1885 regulated by the Local Funds Act, No. IV of 1871, and was in most respects similar to that of the Municipalities under the companion Act, No. III of 1871. From the 1st of April 1885, a new Local Boards Act (Madras No. V

the Collector, Sub-Collector, and Head Assistant, but whenever sub-division can be carried still further, this should be done till every talook has its Local Funds." The first Local Fund Report received under the rules above mentioned was that for 1855-56, but it was incomplete, and the instructions for the credit of local funds were not fully carried out in that year. In 1856-57 the total revenue credited to local funds amounted to Rupees 1,06,000, and that in 1857-58 to Rupees 1,23,300, consisting chiefly of the road fund in South Arcot, and ferry tolls and the proceeds of avenue clippings in other districts and grass-rents, derived from renting out the right of grazing in such places as public bungalow and outcherry compounds, or on the ditches and slopes of forts, and of cart-tax. The last source of revenue, however, shortly afterwards ceased to be an item of local funds, as it was either abolished with the moturpha or profession-tax, of which it formed an item in some places, or was transferred to municipalities, where it was simply a fee for the use of enclosed cartstands. In some places it was abolished as an altogether unauthorized tax. (3) *Imperial and Local Roads*.—In 1856 the question as to what roads should be made and maintained at the direct cost of Government came under discussion, and the Government decided that trunk roads and certain district roads should be made and kept up at the cost of the State. In 1859 the Government of India directed that the proceeds of tolls and ferries on lines of roads constructed and maintained from the public revenues should not be carried to the credit of Local Funds, but credited to the State. This order was cancelled in 1864, and the re-transfer of these sums to Local Funds was again sanctioned. (4) *Additions to Local Funds*.—In 1860 Government directed that the surplus proceeds of the Cattle Pound Fund collected under Act III of 1857 should be carried to the credit of local funds for the purpose of being laid out on works of public utility, and this order raised the funds at once by nearly a lakh of rupees. In 1862-63 two per cent. of the revenue of the Godavery District, charged at the settlement rates, was directed to be set apart as a Road Fund, and the same plan was adopted in all the subsequent settlements made prior to 1866. In 1864 Government having found that fish-rents in Bengal were treated as local funds, applied for and obtained the sanction of the Government of India for treating them as local revenue in this Presidency also. This gave about Rupees 80,000 additional to the funds. In the same year the care of public bungalows was made over to the Board of Revenue, and the grant from Imperial funds was ordered to be credited to a special fund called the Public Bungalow fund, subordinate to local funds. (5) *Revision of Local Fund Rules*.—Local funds having been thus developed, and their amount having been raised from one lakh in 1856 to nearly four lakhs in 1863, the Government of India required in 1864 an annual estimate of receipts and expenditure of local funds. They, however, observed that they wanted the estimate, not that they might exercise any interference with the expenditure of funds which were entirely at the disposal of the Local Government, but merely that they might be kept informed of the outlay for financial purposes and of the nature of the projects in reference to their effect upon the works of the country which were maintained from Imperial Funds. On the receipt of this requisition Government observed that the express abnegation of all desire or intention of interference on the part of the Government of India rendered it incumbent to adopt measures calculated to bring the administration of these funds under their effective control, and accordingly revised the rules of 1856 to the following effect:—"a" the District Conservancy fund was called road fund, the term being more definite and expressive of the real object of the fund; "b" the management of the road fund, which was under the former rules vested jointly in the Collector and District Engineer, was transferred to the Collector, that is, the responsibility of selecting works and making the most of the local funds was made over to the Collector; "c" the detailed audit of accounts was transferred from the Chief to the Superintending Engineer; "d" the Board of Revenue was invested with power of general supervision and required to watch that the budget appropriations were not exceeded, that the balances were duly brought forward, and that the local audit was properly made; and "e" the Engineers were made responsible for carrying out the works, and 10 per cent. of the cost was fixed as the rateable share of the Public Works Department, the previous system of equally distributing the cost over all Local Funds being considered unfair, since local fund works did not generally require high engineering skill. (6) *Road Fund Act*.—These rules remained in force till 1866, when the local revenues amounted to 6½ lakhs of rupees. This amount, however, was manifestly not enough for the wants of the country. It was calculated that at least 2 crores of rupees were necessary to complete, and a sum of 20 lakhs annually to maintain, the roads required for this Presidency; and as there was no prospect of this sum being obtained under the system then in force, and as, moreover, it was considered unjust to collect the cess only from Government tenants and not from Zemindars and Inamdars also, who equally participated in the benefits of local funds and good roads, an Act was passed in 1866, which authorized the Government to levy a road-cess at 6 pies on every rupee of the annual rent-value of all lands, ryotwarry, zemindary, and inam. The Act was brought into force partly in 1866-67 and fully in 1867-68, and raised the Local Funds from 6 to 26 lakhs of rupees. There were no special changes between 1868 and 1870. (7) *Local Fund Bill of 1870*.—Early in 1870 a Bill was introduced, the object of which was to establish a complete system of Local Funds for local purposes. The primary reason for the introduction of the Bill was the necessity which had been long felt for some comprehensive and practical measure for providing sound elementary education for the mass of the population. In 1854, when the question of education was first taken prominently into consideration, it was thought that by a liberal system of salary grants in aid of private efforts, the cost of which was to be defrayed out of the general revenues, and by adopting measures for the improvement of indigenous schools, adequate provision would be made for the elementary instruction of the peasantry; and rules were framed accordingly in 1855. Four years later the Home Government came to the conclusion that the grant-in-aid system was unsuited to the spread of vernacular education among the masses of the people, and in the despatch issued by the Earl of Derby in 1859, the attention of the Government was drawn to the expediency of imposing a compulsory rate to defray the expenses of schools for the rural population. The measure did not find favor at Madras, but in 1863 it became apparent that, however useful the salary grant-in-aid system was, in improving higher and middle class schools, it did very little for elementary education. A Bill was therefore introduced in that year, which subsequently became law as Madras Act VI of 1863, the object of which was twofold. One was to give legal sanction to the collection of a cess for education, which had been voluntarily imposed by the people upon themselves in the Godavery district for the establishment of elementary schools, and the other was to furnish the inhabitants of towns and villages with the means of raising permanent funds for the establishment or improvement of schools. The Act provided that if the majority of the rate-payers in the Godavery district did not petition against the continuance of the schools within two months from the date of a notice which was to be inserted in the Gazette, the schools should be continued for five years, and the voluntary rate charged compulsorily for that period, a similar procedure being observed at the end of every five years. In like manner it was provided that if the inhabitants of any village in any district applied for the extension of the Act to their village, it might be so extended, and the rate voluntarily proposed to be charged by the majority of the people collected compulsorily for five years. When, however, the Act came to be worked, it was found ill-adapted to rural communities. At the end of seven years after the Act was brought into force there were only nine out of nineteen districts in which schools were established under the Act, and the total number of schools was only 104 with an attendance of 3,665 pupils. Act VI of 1863 having thus failed, Government arrived at the conclusion that the imposition of a compulsory rate could no longer be postponed, but, instead of having a special tax for education, it was considered desirable to merge the Road Cess Act of 1866, the Wynaud Tolls Act No. II of 1863, and the Education Act of 1863 into the projected measure, and to raise by a single local rate the funds required for popular education, for roads and other public objects of a local character. The Bill introduced in 1870 was intended to provide for all these purposes. (8) *Discussion on the Bill of 1870*.—The Bill underwent a full and lengthy discussion. The important points discussed were—"a" whether the functions of the committees appointed to administer Local Funds should be confined to advice and criticism, or

of 1884) has been introduced. Under this enactment each revenue district of the Presidency has a district board consisting of a President and not less than 24 members. Each district board may under the law have a number of talook boards under it, and each talook board may have a number of union punchayets under

whether the whole administration should be entrusted to them; "b" whether education should be included among the purposes to which the funds raised under the Act ought to be applied, and, if it was included, whether it should not be elementary education only; "c" whether Local Fund Circles should be coterminous with the Revenue talooks or Revenue divisions in view to ensuring due localization of expenditure, or whether the determination of the size of the circle should be left to the discretion of the Executive Government; "d" what proportion of the funds raised under the Act should be expended on roads; "e" whether the Local Fund Budget should be annually read and discussed before the Legislative or the Executive Council of Government; "f" whether a marriage-tax should be introduced or not for the purposes of the Act; "g" whether the principal highways or trunk roads should be maintained at the cost of the State or from Local Funds. (9) *Functions of the Boards.*—It was considered that it would be of little advantage to have committees with functions limited to the giving of advice. It was observed by one of the members of the Legislative Council that, if the committees were merely to give advice, District Officers would simply name committees composed of men who were not likely to advise except as they were told, and thus there would be the evil of budgets passed under the cloak of non-official recommendation, while in reality they emanated entirely from District Officers. It was thought that it would be far better that the real framers of the budget should be directly answerable to Government rather than that they should have provided for them the convenient buffer of dummy Local Fund Committees. It was therefore on full consideration resolved that the committees should be responsible for the administration, and that their functions should not be limited to those of advice and criticism. The Bill as originally framed contained a provision empowering the Governor in Council to introduce the system of election in the selection of Commissioners, but the provision was struck out by the Select Committee without any reasons being assigned. (10) *Education.*—In regard to education, there was a strong opposition to its being included among the purposes to which the funds raised were to be applied. It was considered by some of the members that a separate Bill providing for a compulsory rate and to some extent for the compulsory attendance of children up to a certain age was a far better way of attempting to grapple with the education question. But eventually the opinion that there ought not to be a multiplicity of taxes, prevailed, and education was inserted among the purposes to which the funds were to be applied. Although it was agreed on all sides that it was only to elementary education that the funds should be applied, it was considered inexpedient to fix any limitation as it was difficult to foresee what the wishes of the people might, in the future, dictate as to the kind of education which was to be supported by the local rates. (11) *Size of circles.*—With reference to the size of the Local Fund Circles there was considerable difference of opinion. The District Officers were consulted; six of them were in favor of limiting the circle to the talook, four were in favor of limiting it to the Revenue division, and ten were in favor of making the Local Fund Circle co-extensive with the district. Although it was felt by the Council that, in order to ensure a due localization of expenditure, it would be advisable that the limits of Local Fund Circles should be coterminous with the revenue talooks, it was considered prudent to leave it to the Executive Government to fix the limits of the several Local Fund Circles in such manner as might seem advisable with reference to the circumstances of each district. (12) *Constitution of a Road Fund.*—As to what proportion of the funds raised under the Act should be expended on roads, there was much difference of opinion; some proposed half and others two-thirds. It was finally decided (section 36) that all the proceeds of tolls and not less than two-thirds of the land-cess should be applicable solely to the construction and maintenance of roads and communications. (13) *Discussion of budget by the Legislative Council.*—Whether the Local Fund Budget should be annually discussed before the Legislative or Executive Council was debated with much warmth. It was admitted by all the members except one that the discussion of the Provincial and Local Fund Budgets in the Legislative Councils would tend to the development of the intelligence, public spirit, and self-governing capacity of the natives, and would enable the Government to fulfil its great mission of teaching India how to manage its affairs, public and private. But the idea was ultimately given up as it was understood that the Government of India anticipated legal difficulties in allowing the budgets to be read before the Legislative Councils. (14) *Marriage-tax.*—The marriage-tax was given up as public opinion, especially native public opinion, was then against it, although, as observed by Mr. A. J. Arbuthnot, the arguments adduced against it were by no means convincing. (15) *Maintenance of trunk lines of road.*—In regard to the trunkroads formerly maintained by the State, it was contended by some of the members that it would be unjust to throw their maintenance on local funds. Mr. Arbuthnot observed that, although with reference to the heavy expenditure which the Government of India had undertaken in connection with the State Railways constructed by guaranteed companies, it was not improbable that before very long the entire cost of the ordinary roads would have to be met by local taxation, no change in that direction was imminent or certain. The immediate object of the Bill was declared to be merely to provide additional funds for the construction of cheap roads which should connect remote villages with the district roads. (16) *Passing of the Local Fund Act.*—The Act was finally passed in February 1871 after a lapse of one year from the date of the introduction of the Bill. The rates, tolls, and taxes leviable under it were as follow:—"a" a rate or cess not exceeding one anna in the rupee on the annual rent-value of all occupied lands—Government, Inam and Zemindary; "b" a house-tax ranging from 5 rupees to 4 annas a year; and "c" tolls on carriages and animals at rates ranging from one anna to one rupee. The house-tax was not to be imposed generally, but only in villages or groups of villages in which a grant-in-aid school already existed, or in which the inhabitants were prepared to establish a school under the grant-in-aid rules, or in which the Government might determine to establish a school. The funds raised under the Act were to be applicable to the following purposes:—"a" the construction, repair and maintenance of roads and communications; "b" the diffusion of education; and "c" the construction and repair of hospitals and dispensaries, lunatic asylums, choultries, markets, tanks and wells; the training and employment of vaccinators, and medical practitioners, the sanitary inspection of villages, cleaning of roads, streets and tanks and other local works of public utility calculated to promote the health, comfort, and convenience of the people. The funds were to be administered by a Local Fund Board consisting of officials and non-officials appointed by Government, the Collector of the district being ex-officio President and having the entire executive power. (17) *Introduction of the Act into the districts.*—In 1871-72, the first year in which the above Act was introduced, Government divided the Presidency into 36 circles, and their gradual extension was contemplated. As a matter of fact, however, there has been a gradual diminution, the number of circles, when the Act was superseded, having been only 21. The land-cess was fixed at nine pies in the rupee in the districts of Godavery, Kurnool, Chingleput, Tanjore, Madura, Tinnevely, Kistna and North Arcot, and at one anna in all the other districts. The total amount of revenue raised in the year for local purposes amounted to Rupees 40,00,000. Unions were established where rate schools, under Act VI of 1863, were in existence, and where good elementary schools were in operation, the number of unions so established being 271, and the whole Presidency was examined and reported on by the Revenue Officers and lists of proposed educational unions prepared, the principle being that the confines of the union should nowhere be more than 2½ miles from the place where the school was or might be established. In 1873-74, however, Government finding that the house-tax was most unpopular and that its immediate and special connection with education was proving injurious to that service and seriously retarding its development, directed it to be held in abeyance from the commencement of that year, but with a view of obviating the necessity for closing the sanctioned union schools in consequence of the loss of income, made a grant of Rupees 66,000 from Provincial funds, and of Rupees 22,000 from the Village Service fund. With the discontinuance of the house-tax, the union fund ceased to exist, and the receipts and charges of all Local Fund schools were incorporated with the general fund. The local funds having become liable for a portion of the cost of roads and Public Works Establishment previously paid by the State, Government contributed 12 lakhs of rupees per annum, of which 11½ lakhs of rupees were for Imperial roads transferred to the care of Local Fund

it. The talook board would in that case consist of a President and of not less than 12 members and the union punchayet would in that case consist of not less than 5 members including the chairman. The Collector of the district is, as under the superseded Act, ex-officio President of the district board, and the Revenue officer

Boards, and the remainder for schools and general purposes. In 1874, 25 per cent. of the actual outlay on works executed by the Public Works Department was fixed as a charge in return for the services rendered by that department in the supervision of works, in lieu of the 10 per cent. allowed before the passing of the Act and of the rateable distribution allowed after it. In 1875-76 Government commenced to withdraw the provincial grants made for roads and other purposes. Thus the maintenance of highways, which was always an imperial charge, is now almost completely thrown upon local funds, and the total saving to the State by the creation of local funds and the transfer thereto of the services formerly rendered at the cost of the imperial exchequer was calculated in 1876 to be 2½ lakhs of rupees per annum. (18) *Amendment Act I of 1878.*—In the Act of 1871 the peculiar circumstances of Malabar were not sufficiently provided for. It was a wealthy district with consequently large requirements of a local character, but the assessment was unusually low and, therefore, the land-coss at one anna per rupee produced an inadequate revenue for local wants. To relieve the strain unfairly caused to provincial funds by supporting the local institutions of this rich district to the detriment of poorer and more heavily-taxed districts and to save the local funds from insolvency the land-coss was raised to two annas per rupee of assessment by Act I of 1878. (19) *Transfer of Public Works from Government to Local Agency.*—One of the most important changes made in developing the independence of the local bodies was that effected in 1878-79 by the transfer of the conduct of all Local Fund Public Works from the Government establishment of Engineers to the staff of the local boards themselves. The repair of roads under the old Road Fund Act was in the hands of the District Engineer and this was not altered by the passing of the Act of 1871, section 25 of which expressly provided for the continuance of such Government officers as were then engaged in performing any executive or ministerial duties in carrying out the purposes specified in the Act. This section is opposed to section 24 which contains the appointment and dismissal of all servants in the President. The framers of the Act no doubt desired to grant complete independence to the boards as regarded establishment, but the practical difficulties of securing efficient professional agency was such that they were compelled to fall back on existing establishments. All the members of the latter being in Government service, their rights had to be respected, and the power of appointment and of summary dismissal conceded under section 24 had necessarily, so far as concerned the Public Works establishment, to remain a dead letter. The budgets were framed by the local boards and not by the Public Works Department; in fact so little had the latter to do with the matter that the review of the budgets in the Secretariat was placed entirely under the Financial Department, an arrangement which continues to the present time. The Public Works officers felt their position as servants of the boards to be anomalous, and the latter on their side considered they had insufficient power over the former, for whose services, under section 27 of the rules framed under the Act, they were compelled to pay 25 per cent., reduced subsequently to 23 per cent., on the actual outlay on works to cover cost of establishment. (20) *Position of Public Works Officers in regard to Local Boards.*—Owing to complaints proffered by various boards from time to time, the question of providing a separate establishment for local fund works came up under a reference from the Board of Revenue in March 1875. The questions submitted for the decision of Government were—"1st, whether the entertainment of separate establishments is feasible and expedient; 2nd, whether, if this question is answered in the negative, the existing charge for Public Works Department supervision is fair and moderate." The arguments adduced in favor of providing a separate establishment were—"1st, that the boards are responsible for the due expenditure of funds, but that they have no control over the establishment expending them; 2nd, that the works are generally of a simple character and do not require professional superintendence of a high order, and that for this and other general reasons the cost of Government departmental supervision is out of proportion to the actual requirements; 3rd, that the Local Fund works do not receive sufficient attention at the hands of Public Works Department, either positively or relatively, to the amount contributed by the local funds towards the payment of the Public Works establishments; 4th, that the relations between the boards and officers of the Public Works Department have too frequently not been harmonious, and that a more complete subordination of the establishment to the boards will tend to obviate this state of things." The Board of Revenue on the evidence before them came to the conclusion that the proposition to entertain separate engineering establishments must be rejected on the three following grounds:—"1st, that it would be practically impossible, having any regard to available means, to officer separate establishments efficiently; 2nd, that the cost of such establishments would certainly be much greater than the local funds seem to anticipate; and 3rd, that regarding the question from an imperial as well as local point of view, double establishment would assuredly be more expensive on the whole than the present arrangements." The Board of Revenue next examined the second point, viz., as to whether the charge of 25 per cent. should be reduced. Here they were "decidedly of opinion that the charge is unduly high relatively to the work performed, especially when it is considered that the staff maintained is often quite inadequate," and recommended that it be reduced to 20 per cent. (21) *Settlement of the questions in 1878-79.*—Matters, however, remained in statu quo until 1878 when Government greatly reduced its staff of Engineers and informed the boards that in future the Government Engineers could undertake no local fund works except those requiring high professional skill, and that they must make their own arrangements for the execution of all other works. The majority of the local bodies on a review of their financial position considered that the residuum of work which would be left to them under this proposed system would not afford adequate funds for the entertainment of a sufficiently high trained and salaried staff, and these bodies accordingly elected for taking over the whole of the local fund work in their divisions. The only exceptions to the arrangement were the local fund boards of the Kurnool, Trichinopoly, and Godavery districts, but each of these has since followed the example of the other boards. The reduction of a large body of trained officers and subordinates from the Public Works staff, each taking away pension or gratuity, often both, presented an opportunity to local fund boards for manning their establishments not likely to present itself again to the same extent. Though many of the individuals so reduced were held to be inefficient in the department, they were not all so; in fact, the services of many of the younger men were dispensed with solely on the grounds of their claims for retention being on this account less than those of their seniors. The boards were thus enabled to make a very fair selection, and no less than 40 officers and subordinates previously belonging to the department were engaged on terms which were in the majority of cases much below those for which they could have been secured at ordinary times. (22) *General results of the transfer to Local Agency.*—The transfer is generally admitted to have been satisfactory both to the boards and to the Public Works Department, and so far no insuperable difficulties have been experienced in manning the Engineering staff of the local fund boards, while all friction between them and the Government Engineers has been put an end to. The amount of expenditure thus transferred from the Government officers to those of the local bodies was nearly 27 lakhs in 1880-81. (23) *Committee of 1883 on Local Government.*—As mentioned in the article on *Mofussil Municipalities* a committee was appointed in June 1883 to report on the general question of local Government in Madras. The committee's proposals in regard to rural tracts were as follows. "a" Each revenue village or group of villages should be constituted a union or rural sanitary district. The unions should be classed as major or minor according as the population was over or under 5,000, but the constitution was still to be the same in character, the governing body in each case being simply a village punchayet. In minor unions, however, the punchayets should be required to provide only for the rudimentary needs of sanitary conservancy while in major unions the punchayets should have wider duties assigned them. In both classes of institutions the union funds were to consist mostly of the house tax already authorized by the Local Funds Act IV of 1871, but the collection of which has been in abeyance since 1873. At the same time certain supplementary sources of revenue were also to be provided. "b" Over the unions there should be the talook committees consisting of at least 12 members exclusive of the President and the Vice-President, two-thirds of which should if possible be elected. The talooks need not necessarily be

in charge of the division of a district where the talook was situated would be the ex-officio President of the talook boards in the division. With the permission of the Governor in Council, any local board can elect its President or Vice-President. All the divisional officers of a district are ex-officio members of the district board of that district. Each headman of a village is an ex-officio member of the punchayet of the union wherein the village is situated, if such divisions are constituted. The number of officials on any district board should not exceed one-fourth of the total number of members; in the case of the talook board the proportion is one-third. Three-fourths of the members of a district board can with the permission of the Governor in Council be elected. The same would be the case to the extent of

conterminous with ordinary revenue talooks, but should be defined to be such local area as Government might declare to be a talook. "c" Above the talook committee should come the district board consisting of at least 24 members exclusive of the President, the members, to be eventually formed for the most part of representatives delegated by the talook committees of the district though in the first instance nominated by Government. The committee further recommended that the introduction of the above system should be only gradual, and with this view proposed as follows. "a" In revenue districts in which there is now more than one circle board, they should be amalgamated. "b" The number of members should be increased so as to secure more local knowledge and to interest a larger number of people in the administration. "c" The proportion of official members should be reduced from one-half to one-fourth of the whole number. "d" The post of Vice-President of the district board should be abolished and his place supplied by the appointment of a Secretary to the President and of a Chairman of the board. "e" The control now exercised by the Board of Revenue should be resumed by Government, which should then deal directly with the local fund boards as it now does with Municipalities. "f" The Local Fund Rules should be so modified as to give greatly increased independence and powers of sanction to the local bodies. "g" The control and management of Government primary and middle schools should be made over to the local boards and the relation of the Educational Department to the local boards should be better defined. "h" The relation of the Medical Department to the local boards should be better defined and placed on a more satisfactory basis. "i" The control of pound funds and the whole of the surplus receipts should be transferred to the local boards. "j" The minimum proportion of the land-cess devoted to the road fund should be reduced from two-thirds to one-half to enable the general fund to bear the charges now falling on it. The Government expressed their general concurrence with all the above proposals, but in regard to the disposal of the surplus pound fund receipts, it was decided as observed in the article on mofussil municipal administration that it was not desirable to effect any alteration in the existing system. The proposal about the appointment of a paid Secretary instead of a Vice-President, though approved by Government, has not been adopted in the Act. (24) *New Act of 1884.*—A new Act embodying the several proposals above referred to has now been passed and introduced into the several districts from 1st April 1884. This enactment is entitled the Madras Local Boards Act 1884 and supersedes the Madras Local Funds Act IV of 1871. Under section 1 (2) of the Act, it shall come into force in any district on such date as the Governor in Council may by notification direct. Section 5 empowers the Governor in Council to declare any part of a district to be a talook for the purposes of the Act and also to modify or cancel such declaration. Under section 6 any village or group of villages can be declared to be an union for the purposes of the Act and such declaration can be modified or cancelled. Section 8 declares that each district board shall consist of a President and of not less than 24 members. The Act of 1871 has been followed in making the Collector ex-officio President. Under section 9 (2), however, the Governor in Council may authorize the members of any district board to appoint their President by election from among their own member. Every revenue officer in charge of a division of the district shall be an ex-officio member of the district board (section 10). All the other members may be appointed by Government or with the permission of Government any proportion not exceeding three-fourths of them may be elected by the members of the talook boards in the district, or if there is no talook board in any part of the district by the punchayets and by the tax-payers and inhabitants of each part of the district; but not more than one-fourth of the whole number together with the ex-officio members can be salaried officers of the Government unless they have been elected. Section 14 declares that each talook board shall consist of a President and of not less than 12 members. The revenue officer in charge of the division shall be ex-officio President unless the Governor in Council authorizes the members of a talook board to elect their own President from among their number. The members of the talook board may be appointed by Government, or with the permission of Government any proportion not exceeding two-thirds may be elected by the punchayets in the talook or by the tax-payers and inhabitants of the talook, but not more than one-third of the whole number can be salaried officers of Government unless they have been elected. Section 20 further provides that each local Board may have a Vice-President either appointed by Government or elected by the members if the boards are empowered by Government to do so. The punchayets of each union shall consist of not less than 5 persons, the headman of each village being an ex-officio member, and the other members being either wholly appointed by Government or partly so appointed and partly by election—the number of elective members to be fixed by Government. The Government can also appoint one of the members of a punchayet to be their chairman or authorize them to elect their own chairman. Under sections 24 and 126 the Government have power to remove the President, Vice-President or any member of a local board and the chairman or any member of punchayet. The executive officer of the local board is the President who is responsible for carrying out all the purposes of the Act. The President can however authorize the Vice-President to exercise any of the powers conferred on him by the Act. Similarly the executive officer of the punchayet is the chairman who can however delegate his duties to any of the members. As in the District Municipalities Act, provision has been made against any possible neglect or default on the part of the President of a local board or chairman of a punchayet in carrying out a resolution of the board or punchayet by giving the Collector of the district in the case of local boards and the President of the talook board in the case of punchayets, authority to assume the execution of such resolution. The Collector can also exercise control in the event of a local board adopting illegal measures likely to endanger the public peace, human life, health or safety, and can also provide for quick and energetic action in cases of emergency. When a divisional officer is not the President of a talook board in the division he can exercise the powers of the Collector above referred to in respect of such board. Similar control over punchayets is to be exercised by the President of the talook board, but provision for energetic action in cases of emergency has even here to be made by the revenue officer in charge of the division wherein the union is situated. The punchayets are however to work under the control and direction of the talook board. The position of Government servants lent to local boards has been clearly defined and that of the local boards' servants improved. The only new taxes authorized are fees for licenses granted for the temporary erection of pandals and other structures in streets and other public places in an union and fees for the temporary use of cart-stands, markots, market-sites, village-sites and other similar public places on the occasion of fairs and festivals. Market and cart-stand fees were however levied even under the Act of 1871 for use of places provided by the Local Fund Board for such purposes. The levy of the house-tax authorized by the Act of 1871 is authorized by the new Act also, but the proceeds instead of being spent on schools have to be devoted to the improvement of the sanitation of villages. The restriction about two-thirds of the land-cess being set apart for expenditure on roads has been removed. The formation of talook boards and punchayets has not yet taken place nor have the rules giving the local boards wider powers been passed. The direct control over the funds has been resumed by Government from the Board of Revenue.

two-thirds, in a talook board. In the case of punchayets the proportion would have to be fixed by Government. The whole executive power of a local board vests in the President, and the President is directly responsible for the due fulfilment of the purposes of the Act. Further particulars about the constitution of these bodies will be found in the first foot-note. There are at present 785 members, belonging to 30 boards, or an average of 26·2 members on each board. Of these, 357 members, or 45·5 per cent., are officials, and 428, or 54·5 per cent., are non-officials. To induce non-official members to attend meetings, the Government have sanctioned payment of travelling expenses to such as live at a distance.

834. SOURCES OF INCOME.—The Local Funds administered by the Boards consist of:—(1) taxes raised under the Act, (2) grants from general revenues, (3) Special funds allotted by Government, (4) endowments, and (5) miscellaneous items which will be enumerated hereafter.

835. The taxes leviable under the Local Fund Act are:—(1) a tax not exceeding 2 annas in the rupee, on the annual rent-value of all occupied lands, on whatever tenure held in the districts of Malabar, South Canara, and the Neilgherries and not exceeding one anna in the rupee on the annual rent-value of such land elsewhere; (2) a tax on houses, varying from 4 annas to 5 rupees per annum on each house; (3) tolls upon carriages, carts or animals passing along roads within the circle, varying from 1 anna to 1 rupee; (4) fees for licenses granted for the temporary erection of pandals and other structures in streets and other public places in an union; and (5) fees for the temporary use of cart-stands and of markets, market-sites, village-sites, and other similar public places on the occasion of fairs and festivals. The tax on houses cannot be imposed except in villages, or groups of villages, comprising an union, and cannot be spent except on village sanitation and improvement of village streets. The net proceeds of all tolls must also be applied to the construction, repair and maintenance of roads and communications. The restriction in the old Act that two-thirds of the revenue from land-cess should also be spent on the same object has been removed by the new Act. The last three of the sources of income have not been utilized as yet under the Act; though often in force apart from it. The land-cess is charged on all land occupied under the ryotwarry, inam or any other tenures, the maximum rate chargeable being in all districts 1 anna in the rupee of the rent-value, except in Malabar, South Canara and the Neilgherries where the rate can be 2 annas. Malabar, however, is the only district where this higher rate is now levied. In the other districts where the lower rate is in force, the maximum rate is collected in all but one, viz., Godavery,

[?] AREA, POPULATION AND REVENUE OF LOCAL FUND CIRCLES.

where the rate is 9 pies per rupee. In order to avoid inquiry into the rent-value of each holding, the law provides that, in the case of ryotwarry and inam lands, the assessment paid or payable to Government, together with any water-rate chargeable thereon, shall be taken to be the annual rent-value, the amounts payable by the tenants in the case of other tenures being taken as the rent. In the case of Zemindarries however, the full rate is not collected on the entire revenue derived by the Zemindar from his tenants, but a remission of half of the land-rate is allowed on so much of the revenue as is equal to the amount of the peshcush payable to Government in respect of such land. The Inamdars and Zemindars are further allowed to levy from the tenants half the land-cess which they pay to Government. The collections of land-cess in 1883-84 amounted to Rupees 43,57,000, or 75 per cent. of the whole revenue for the year. Tolls are leviable under the Act on carriages, carts or animals passing along the roads within the Local Fund Circles at rates varying from 1 anna to 1 rupee, but the maximum rates are not levied everywhere. The rates charged are however nowhere less than half the maximum. The total number of toll-gates which existed at the close of 1883-84 was 137, and the revenue derived from them amounted to Rupees 3,37,000. Besides the above, contributions are received from Municipalities to the extent of Rupees 1,05,000 from the tolls collected by them within their towns. This payment is made not under the provisions of any law, but simply as an arrangement between Local Fund Boards and Municipalities with a view to avoid the establishment of separate Local Fund toll-gates in close proximity to those of the Municipalities. The vehicles paying Municipal tolls pass along the Local Fund roads, and the division of tolls therefore between Local Fund Boards and Municipalities is strictly equitable. The total income from tolls amounts to 8 per cent. of the Local Fund income.

836. As mentioned in the first foot-note grants from general revenues were largely made during the first few years after the introduction of the Local Funds Act IV of 1871 on account of services transferred from imperial to local funds, but the grants have been gradually reduced and confined to special localities and special works. The amount of grants in 1883-84 was only Rupees 1,73,000, while in 1871-72 it was 12½ lakhs. Of the former, Rupees 1,17,000 were granted on account of roads in the Neilgherry and Rupees 25,000 on account of those in the South Canara district.

837. The special funds allotted for local purposes are contributions from the canal and ferry fund and half surplus of pound fund, besides fish rents allotted from general revenues. Fish rents are levied for the right of catching fish in Government tanks, channels and other reservoirs. In 1883-84 the collections amounted to Rupees 98,000, or 1.7 per cent. of the total income. The right of ferrying across rivers, channels and backwaters is leased out by Government subject to rules laid down by them in regard to the conveyance of passengers and goods and the rates to be levied from them. This right is exercised by Government not under any law but under the sanction of immemorial custom. The rents of the ferries are made over to Local Funds. Besides the above, which does not come under the head "Special Funds," but under "Miscellaneous," revenue is also derived from the application of the Canal and Ferry Acts, No. I of 1870 and No. IV of 1878, to a few districts, and the net proceeds, after meeting the expenses necessary for the proper working of the ferries, are assigned to Local Funds, under the special orders of Government, for the improvement of roads leading to those ferries. The amount derived in 1883-84 from this source was Rupees 1,21,000, or 2.1 per cent. of the total income. Under Act I of 1871, the surplus proceeds of the Cattle Pound Fund are to be appropriated to the construction and repair of roads and bridges and other purposes of public utility, and under this provision Government has directed that half the surplus proceeds collected in each circle should be paid to the Board concerned and that the other half should be devoted to the maintenance of the Government Farm at Sydapett. The amount thus credited to Local Funds in 1883-84 was Rupees 33,000.

838. The revenue under endowments is chiefly derived from lands with which choultries have been endowed by the former rulers of the country and by private

individuals. An income is also derived from the rents of buildings attached to the institutions, from interest on funds invested, and from grants made by Government in lieu of resumed inams and fees. Most of the endowments are to be found in Tanjore, Madura and Tinnevely. The endowed institutions consist of choultries, dispensaries, water-pandals, bridges, ponds and tanks. All these institutions were formerly under the direct management of the Board of Revenue, under Regulation VII of 1817, but they have since been transferred to Local Fund Boards and these bodies now occupy the same position and have the same responsibilities as the Board of Revenue under the old Regulation (section 51, Act V of 1834). The revenue from endowments amounts to about $2\frac{3}{4}$ lakhs of rupees per annum.

839. The miscellaneous revenue consists of the items given in the footnote below.^[3]

840. AMOUNT OF INCOME.—The total income of the Local Fund Boards is thus about 58 lakhs of rupees as shown below.^[4] Contributions between circles and refunds, &c., are omitted from the statements. Hence the difference between the total as shown here and that as given in the second footnote. The incidence of taxation per head of the population is only two annas and six pies exclusive of tolls, or two annas and nine pies inclusive of tolls.

841. OBJECTS OF LOCAL FUND EXPENDITURE.—The funds raised under the Act are applicable to:—(1) the construction, repair and maintenance of streets, bridges and other means of communication; (2) the planting and preservation of trees on sides of roads and on other public places; (3) the construction and repair of hospitals, dispensaries, lunatic asylums, choultries, markets, drains, sewers, water-works, tanks and wells, the payment of all charges connected with the objects for which such buildings have been constructed, the training and employment of vaccinators and medical practitioners, the sanitation of towns and villages, the cleansing of the streets, tanks and wells and other works of a similar nature; (4) the diffusion of education, and, with this object in view, the construction and repair of school-houses, the establishment and maintenance of schools either wholly or by means of grants-in-aid, the inspection of schools, and the training of teachers; (5) the establishment and maintenance of relief works in time of famine or scarcity; (6) other measures of local public utility calculated to promote the safety, health, comfort or convenience of the people; (7) the payment of salaries, leave allowances, pensions, gratuities and compassionate allowances to servants employed by the local board; and (8) the payment of all expenses specially provided for by the Act, but not included under the preceding heads. For the purposes of administration, the funds are divided into three minor heads, viz.:—(1) the Road Fund, (2) the Endowment Fund, and (3) the General Fund. The

[3] MISCELLANEOUS REVENUE OF LOCAL FUND BOARDS IN 1883-84.

	RS.
School-fees	44,800
Contributions from Municipalities	5,000
Travellers' Bungalow fees	11,400

road fund consists of (a) two-thirds of the collections within the year of the cess on the rent value of land, (b) the proceeds of tolls, (c) grants of money from general revenues and other contributions made specially for the maintenance or construction of communications, and (d) such appropriation in excess of the two-thirds of the collections of the cess as may be assigned to it. Fish rents, ferry rents, and surplus pound funds are also credited to this head, except in places where the general fund is insufficient and requires to be supplemented by these special funds. The nature of the endowment fund has been already explained. The general fund consists of all revenues other than those credited to the first two heads. The road fund is expended exclusively on the construction, repair and maintenance of roads and communications, and the endowment fund on purposes to which it was lawfully applicable at the time when the endowment became vested in the Local Fund Boards. The general fund is available for all purposes for which local funds can be lawfully expended. The new rules, under Act V of 1884, which will shortly be introduced, will do away the distinction between the road and general funds.

842. PUBLIC WORKS.—The expenditure relating to public works is the most important. In the year 1883-84 it amounted to Rupees 41,69,000 or 69 per cent. of the total expenditure. This expenditure related mainly to roads, but included also expenditure from endowment and general funds. The outlay on roads including a portion of the cost of the Engineering establishment was Rupees 38,35,000, or 62·9 per cent. of the whole local fund expenditure of the year. All the roads in the country with a few trifling exceptions in the hill tracts are maintained from local funds and by local agency. The mileage so maintained was 18,624 miles of district road, and 256 miles of new roads were completed and 325 were in progress during 1883-84, besides 140 miles of new village roads constructed and 2,422 miles maintained in order. In addition to this expenditure on communications, Rupees 81,000 were spent in that year on objects connected with the endowment fund and Rupees 2,53,000 on those supported from the general fund. The list of the works carried out in 1883-84 given at foot will furnish an idea of the nature of the works undertaken by the local boards.^[5]

843. EDUCATION.—The Local Funds Act IV of 1871 was introduced, as stated in the first footnote, mainly with a view to provide for elementary education.

[5] LIST OF WORKS CARRIED OUT IN 1883-84.

Completed.	In progress.	Repaired.
13 dispensaries. 1 midwife's quarters. 8 choultries. 1 bungalow. 2 school-houses. 2 school-rooms. 2 contagious disease ward 6 dispensary sheds. 3 dispensary compound walls. 1 chuttram compound wall. 12 latrines. 1 platform to a dispensary. 1 dispensary out-house. 1 record-room in the Collector's office. 1 Local Fund Engineer's office and residence. 2 bath-rooms. 2 store-rooms. 1 stable. 1 cholera-shed. 2 store-sheds. 1 rest-shed. 6 sheds. 3 cisterns. 1 dust-bin. 5 tanks. 14 wells. 1 rest-house and bandystand. Other minor miscellaneous works.	11 dispensaries. 17 school-houses. 4 choultries. 1 bungalow. 1 Hospital Assistant's quarters. 1 Range Officer's quarters. 1 Apothecary's quarters. 1 Local Fund Engineer's rest-house. 1 Assistant Engineer's office. 5 latrines. 1 tiled ware-house. 6 wells. 1 tank. 1 police ward. 1 police dispensary cook-room. 1 shed. 1 compound wall round a dispensary. 1 stable. Other minor miscellaneous works.	51 dispensaries. 56 school-houses. 35 chuttrams. 116 bungalows. 11 inspection bungalows. 2 dead-houses. 1 lying-in ward. 3 dispensary sheds. 2 bandypettas. 2 cholera-sheds. 2 Hospital Assistant's quarters. 2 Apothecary's quarters. 2 Local Fund Engineer's offices. 1 granary. 45 wells. 52 tanks. 3 ponds. 22 sheds. 6 rest-houses. Other minor miscellaneous works.

The rules under the Act as originally drafted, had special reference to this subject. They contemplated that the educational administration should be conducted by means of unions controlled by special committees appointed by Government under section 33 of the Act. This scheme however has not obtained practically. The rules were revised in 1879. Under these revised rules there are the following provisions (a) Budget estimates of receipts and charges for education are subject to the ordinary budget provisions and are finally sanctioned by Government. Nearly all new items of charge require separate and previous sanction, before inclusion in the budget. (b) If committees have been appointed under section 33, they frame the budget and submit it to the local board. (c) The boards may provide for education wholly or partly by their own agency or by private agency, aided on either the salary or results system of the Grant-in-aid Code. But in practice they very frequently aid on a combination of the two systems. (d) As regards schools maintained by the board, they have absolute power to determine whether or not fees shall be levied, and, if levied, the rates; and to fix the strength of the teaching staff, the appointment of teachers resting with the President. The former power however cannot be exercised in the case of schools receiving aid from provincial funds. If a special committee of management constituted under section 33 exists, all bills must be signed by the President of the board and two members of the committee; such committees have also to submit annual reports. Before a Local Fund school can be opened, the sanction of Government must be obtained, the application being submitted through the Director of Public Instruction, after the opinion of the local educational officers has been obtained. No school can be closed without the sanction of Government being obtained in the same way. (e) If aid be given on the salary system, it must be under the rules of the Grant-in-aid Code and be limited to elementary education. (f) If aid be given on the results system, it must be according to the provisions of the Grant-in-aid Code relating to results grants. (g) Local boards should ordinarily constitute results schools which bid fair to be permanent Local Fund schools, unless the managers wish to maintain the school on the salary system. (h) All charges in regard to schools aided by the boards are subject to strict scrutiny. (i) The salaries and allowances of Inspecting Schoolmasters are to be borne by the boards, but the agents are under the control of the superior educational officers who should determine their duties in communication with the boards. Although the code of rules provides only in a cursory manner for interference on the part of the Educational department, yet in practice that department has been the chief agency through which Local Fund Boards have hitherto administered their educational affairs. Provision has been made in the new Act V of 1884 for expenditure on sanitation being met entirely from house-tax and fees. This measure will set free for expenditure on education the portion of the land-cess hitherto devoted for sanitation. The new rules framed under the Act, which will shortly be passed, contemplate giving the local boards wider powers as regards the establishment and closing of schools and the appointment of their educational officers. All aids given by the boards should be in accordance with the rules of the Grant-in-aid Code, and in regard to the levy of fees they should be guided by the fee notifications of Government issued from time to time. The boards are also entitled under these rules for aid under the Grant-in-aid Code for all objects enumerated in the code excepting the lower primary education of boys. The people resident in rural circles number 29,133,313, and theoretically there should be under instruction about two million and a quarter boys and two million girls. At the close of 1883-84, there were 341,985 children, or 1.173 per cent. of the population in schools connected with the Educational department, and if children in schools not connected with the department are taken into consideration, the total figure would probably be about 400,000. In these circles the Government was maintaining 34 middle schools with 2,248 pupils, and 10 primary schools with 420 pupils. Similarly, local boards had 110 middle schools with 6,061 pupils, and 1,003 primary schools with 1,920 pupils. There were 9 private middle schools, aided on the salary system, with 596 pupils and 21 primary schools with 731 pupils. Under the result and combined systems there were 274 middle schools with 11,962 pupils and 7,678 primary schools with 189,035 pupils. The

expenditure on education was as shown at foot.^[6] The receipts from fees were as shown below.^[7] Government middle schools are nearly half self-supporting, and with primary departments to a considerable extent. The reverse is the case in boards' schools. The inferior inspecting agency consisting of Inspecting Schoolmasters is paid from local funds. One hundred and seventeen of these agents were employed in 1883-84 at a cost of Rupees 56,900. At the close of 1883-84 there were twenty-nine elementary training schools for teachers under the local boards. Three more are about to be established. The remaining Provincial elementary normal schools will be transferred to them before long. The rules of admission to these schools ensure as far as possible that the men trained belong to the class of indigenous village teachers. Experience has shown that the sons and relatives of village masters readily attend such schools, if proper inducement be held out, and that it is by far the most efficacious means of improving rural primary schools. The administration of boards' schools varies much in different circles. No uniformity exists in the matter of fees. Little has been done to provide such schools with suitable buildings or apparatus, and in this respect the majority of them differ little from pyall schools. The salary grants system has not been much utilized although this was contemplated by the framers of the Local Funds Act. The reason is that the responsibility of Local Fund Boards is mainly limited to primary education. Aid under the results system is limited to lower primary schools, that is, standards I, II, and III, but grants earned in girls' schools under these standards are debitable to Provincial funds. Rapid increase may be expected in the expenditure for those standards as schools are supplied with trained masters or with men who have received a fair general education. In the year 1881-82 the aid so given was as follows:—first standard Rupees 75,909; second standard, Rupees 75,170; third standard, Rupees 51,211.

844. HOSPITALS AND SANITARY.—The number of hospitals and dispensaries in existence shows progressive increase, 20 or 30 being added to the list every year. There are now 206 such institutions, or an average of 9·8 for every district throughout the Presidency, independently of those maintained by the Municipalities. The institutions are among the most popular objects of local expenditure, and 19 of them possess endowments of a larger or smaller amount. The number of patients treated during the year 1883-84 was 980,000, of which nearly 11,000 were in-patients and the remainder were out-patients. The total cost of the hospitals and dispensaries was Rupees 2,78,539. Adding to this the expenditure, Rupees 1,321, on account of medical practitioners, principally quinine distributors, contributions to municipalities and missionary bodies for medical purposes, amounting to Rupees 82,909, the payment of Rupees 26,080 to Provincial funds towards the Medical College at Madras, and Rupees 13,915, the cost of maintaining at the Madras and Waltair Asylums the lunatics sent from the different circles, the

total outlay on medical services throughout the Presidency from local funds aggregated Rupees 4,02,764, which is 6·6 per cent. of the total expenditure. With few exceptions, all the dispensaries are in charge of Government Apothecaries and Hospital Assistants whose services are lent by the State and who are posted to the several districts by the Surgeon-General with the Government of Madras, the particular dispensaries to which they are to be posted being left to the decision of the Presidents concerned. The exceptions are dispensaries in charge of Pensioned Apothecaries and Hospital Assistants and of Local Fund Hospital Assistants trained in Local Fund Medical schools. Medicines, surgical apparatus and supplies are obtained by local boards on payment from the Madras Medical Stores, excepting such articles as can be locally purchased. The Vaccination establishment is under the professional supervision of the Sanitary Commissioner who has the power of appointing Deputy Inspectors of Vaccination. Each circle has one or two Deputy Inspectors and they supervise the work done by the vaccinators who are nominated by them, but formally appointed by the President of the Local Fund Board. The Local Fund Boards have the power of determining the strength and pay of vaccinators, but it is a rule that there should be at least one first-class Vaccinator in each talook, and his minimum salary is fixed at Rupees 15. The staff consisted in 1883-84 of 44 Deputy Inspectors and 606 Vaccinators. The total cost of vaccination in 1883-84 was Rupees 1,33,000 or 2·2 per cent. of the total expenditure and the number of persons successfully vaccinated was 566,000, at an average cost of three annas and nine pies per head. The expenditure under sanitation was Rupees 2,62,300 or 4·3 per cent. of the total charges. The various objects on which the outlay was incurred are detailed below.^[*] Improvement of water-supply receives great attention, and a vast number of wells throughout the country are made either wholly at local fund expense or with the aid of grants proportionate to the amount contributed by the persons most immediately interested. Sanitary associations are found in several of the larger villages for supervising sanitary operations, and in these villages the local contributions for sanitary purposes are supplemented from the general Local Funds. The total number of choultries maintained by the local boards in 1883-84 was 329. Of these, travellers are fed in 57 chuttrams, the number so fed during the year above named being nearly two millions and two hundred thousand. The cost of feeding was 68,500 rupees. There are 236 travellers' bungalows under the control of the local boards. The cost incurred on account of them in 1883-84 was Rupees 24,000, and the number of travellers who made use of the bungalows was 8,054. Contributions to municipalities are chiefly for the maintenance of hospitals and dispensaries which benefit municipalities as well as local boards. The amount expended under this head in 1883-84 was Rupees 77,370.

845. AMOUNT OF EXPENDITURE.—The total charges above described, inclusive of the cost of controlling establishments, amounted in 1883-84 to Rupees 60,92,000 as shown below.^[*]

846. RELATIONS OF THE BOARDS WITH GOVERNMENT.—The powers of control taken by the Government are, as under the District Municipalities Act, of a financial nature. Section 150 of the Local Boards Act is identical with section 251 of the District Municipalities Act, and authorises Government to pass orders on the budgets and supplemental budgets; and under both Acts Government has power to prescribe the method of the audit of accounts, and to make rules for the application of the funds (sections 95 and 144, Act V of 1884, and 113 and 250, Act IV of 1884). Taxation under the Local Boards Act is imposed and levied by the Governor in Council, while Municipal taxes are levied by the councillors with his approval. With this difference the provisions of the two acts as to the powers of Government are the same. No rules have been framed by Government under the Municipalities Act, but there exists a body of minute rules, 176 in number, compiled by the Board of Revenue, and prescribed by Government under the Local Boards Act. These were framed originally in 1879. Many of them are already obsolete owing to changes of system. These have recently been revised by the Board of Revenue, and they are under consideration. Government has also the power (section 118) to direct a local board to contribute out of its funds towards the expenses incurred by another board or municipality, where such expenditure is incurred for any of the legal purposes of the act and is calculated to benefit the inhabitants of the contributing district or talook, with the proviso however that no such order shall be binding upon them until they have had an opportunity of expressing their opinion as to its propriety or otherwise. Government has power under section 152 to appoint officers to inspect or superintend the operations of the board, and the boards are liable for the cost of such appointments. No special appointments have as yet been made under this section by the Government. Power is reserved to Government to appoint local committees for the management of schools, dispensaries and other institutions, maintained or aided by the board; provided that such committees must act in subordination to the boards. Government pass orders as to the number of officers to be employed by the boards and the salaries to be assigned to them. They finally fix the rate at which each tax may be levied in each district, talook or union, and undertake to sanction a reduction or remission of any tax, in the case of any person or classes of persons, on the ground of poverty or inequality of taxation or for any other reason. Under section 71, of the old Act, Government delegated to the Board of Revenue most of its functions and powers in connection with local funds. From the 1st of April last however this work has been resumed by Government. Extracts from the budget are sent by the local boards to the Director of Public Instruction, the Surgeon-General with the Government of Madras and the Sanitary Commissioner, who submit their remarks on the adequacy and appropriateness of the provision made for the educational, medical and sanitary needs of the circle. The budget cannot be departed from without sanction. A reserve of 10 per cent. of income is set apart to meet unforeseen contingencies and the sanction of Government is necessary to an appropriation from this or from the closing balance, or from sources of income not provided for in the budget.

847. FINANCIAL.—Estimates for new works amounting to Rupees 1,000 or less, have hitherto been sanctioned by the Local Fund boards, and those from Rupees 1,000 to Rupees 5,000 by the Board of Revenue, while those exceeding Rupees 5,000 have been sanctioned by Government. Under the rules now under revision, the district board will have power to sanction estimates up to a limit of Rupees 5,000, and the talook board up to Rupees 2,000. All estimates for the repair of works, not provided for by maintenance grants, have been in the same way hitherto sanctioned by the Local Fund Boards, provided only that in the case of those exceeding Rupees 10,000 the sanction was notified to Government through the Board of Revenue. Plans and estimates of new works costing Rupees 2,500 and upwards, and of repairs except re-metalling of roads costing upwards of Rupees 10,000, and of all other works in which professional supervision may be considered desirable are forwarded to the Chief Engineer, and his approval is necessary before the works are sanctioned by the competent authority. The last-named rules are under revision. The only change proposed is in the pecuniary limit, which has not yet been definitely fixed. Sections 54 and 56 respectively of

the Act provide that "the district and talook funds shall be lodged in such Bank or Government Treasury as the President, under the orders of Government, may direct, and section 140 of the Act provides that the Union Fund shall be lodged in the nearest Government Treasury or with the approval of the talook board with some private bank or banker. All expenses incurred by the President or Chairman as the case may be shall be paid out of such funds, and all orders or cheques upon the district or talook fund shall be signed by the President, or, in his absence, by any officer authorised by him for the purpose, all similar orders or cheques on the union fund being signed by the chairman alone. Under arrangements made by the Accountant-General in 1882, the system of audit has been localised and improved and may now be regarded as satisfactory. It is conducted continuously in the districts in the Collectors' offices and is checked by inspecting officers who visit the districts in turn under the orders of the Accountant-General and examine the work of the local auditors.

848. STATISTICS.—The amount of revenue collected and the expenditure incurred in each year from 1856-57, the second year after the creation of local funds, up to 1883-84 is shown below.^[10] The great variations in the receipts from other sources are due chiefly to the item public works refunds which are merely matters of account. They will now cease as the public works are no longer executed by the Imperial Engineers. The normal receipts from other sources are about Rupees 12,00,000 per annum.

STATISTICS.

849. NATURE OF THE SUBJECT.—There is no separate statistical department under the Government, each executive department and each branch of the Secretariat recording such statistics as it is principally concerned with. The Board of Revenue records more statistics than any other department. Its volume of Trade and Navigation issued to the public is especially noticeable. In the Public Department how-

ever of the Secretariat are concentrated the arrangements for obtaining yearly reports from each executive department and for consolidating them into a single Presidency Administration Report. A considerable portion of these reports is statistical, and the statistics in these which are designed for reproduction in the Presidency Administration Report follow the forms prescribed by the 1866 Statistical Committee of the Government of India, being uniform for the several Presidencies. In Vol. II, App. XCI, are shown the different materials which are combined to make the Presidency Administration Report. A junior officer is appointed yearly to effect the central compilation.
